

MANUFACTURING PERFORMANCE MEASUREMENT TOOL  
FOR SMALL AND MEDIUM-SIZED ENTERPRISES

ELITA AMRINA

A thesis submitted in fulfillment of the  
requirements for the award of the degree of  
Master of Engineering (Mechanical)

Faculty of Mechanical Engineering  
Universiti Teknologi Malaysia

SEPTEMBER 2009

Dedicated with love and gratitude to my beloved mother, late father,  
brothers, sisters, husband, and son.

## ACKNOWLEDGEMENTS

In the name of Allah, the Most Gracious, the Most Merciful. I am thankful to Allah, Lord of the universe for making me able to undertake this research.

The completion of this thesis has involved a lot of people to whom I would like to express my sincere thanks and gratitude for their help. First, I would like to express my sincere appreciation to my supervisor, Prof. Dr. Sha'ri Mohd Yusof, for his invaluable guidance, encouragement, suggestions, and motivation. He has spent a lot of time and effort to discuss, guide, and comment on every aspect of this thesis.

Secondly, I would like to express my sincere thanks and deep gratitude to my mother for her encouragement, her love and care, and her support always to achieve and succeed. I am also grateful to my brothers, sister, and other family members for their love, constant support, understanding, and caring for all these years. I also want to express profound thanks to my husband and son for their love, support, encouragement and understanding. They have lost a lot due to my study abroad.

Special thanks to all members of E04 postgraduate room, all of my sweet family in L12 Kolej Tun Hussein Onn UTM, and all PPI-UTM members for their encouragement, discussion, kindness, and friendship. Finally, I want to express grateful thanks to MOSTI for funding my study. This support is gratefully acknowledged.

## ABSTRACT

Competitive pressures in global manufacturing are forcing manufacturing organizations to re-examine and modify their competitive strategies. Small and Medium-sized Enterprises (SMEs) are not exempted from these pressures. They have to pay more attention to the changes in manufacturing performance system including the measures. Although manufacturing performance measurement has been in existence for many years, it seems that there is no consensus on the collective set of measures used by companies. Most researchers and authors defined the manufacturing performance measures in terms of quality, cost, delivery and flexibility. There is also a bulk of researches that used other measures such as time, human resources, financial, customer satisfaction, innovation, and efficiency. Very few researches have developed the manufacturing performance measurement for SMEs. Based on the literature review of previous studies, this study has proposed a set of manufacturing performance measures for SMEs consisting of six factors i.e. quality, delivery, cost, flexibility, time, and labor, which are the most commonly used measures in previous studies. A total of 32 dimensions were then derived from relevant literature. A survey has been conducted in matching the measures with industry practices. It was found that most of the measures are being applied by Malaysian automotive SMEs. Quality and cost were found to be the most frequently used, followed by delivery and time which also have high usage level, but labor and flexibility were placed at a low usage level. Finally, a total of 25 measures have been proposed to assess manufacturing performance in SMEs. Analytic Hierarchy Process (AHP) methodology was applied in developing a tool of manufacturing performance measurement for SMEs. This tool enables and assists SMEs in their efforts to continually improve their manufacturing performances so as to become efficient and effective. While the tool provides a systematic approach for quantitative assessment of manufacturing performance, it is not entirely automated. Thus for that purpose, a software-based tool was subsequently developed by using PHP and MySQL. Two case studies have been conducted to validate the tool. Results from the case studies suggested that the tool is appropriate and suitable to assess manufacturing performance in SMEs. The tool identifies the strengths and weaknesses that indicate where and how improvements need to be made. It provides the direction to practice continuous improvement towards achieving excellence.

## ABSTRAK

Tekanan persaingan dalam perkilangan global memaksa organisasi perkilangan untuk menyelidiki semula dan mengubah rancangan persaingan mereka. Industri kecil dan sederhana tidak terkecuali dari tekanan ini. Mereka harus memberikan lebih perhatian terhadap perubahan dalam sistem prestasi perkilangan termasuk ukurannya. Meskipun pengukuran prestasi perkilangan telah lama ada, ia kelihatannya tidak ada persetujuan atas susunan kumpulan ukuran yang digunakan oleh pihak syarikat. Kebanyakan penyelidik dan penulis menentukan ukuran prestasi perkilangan dalam istilah kualiti, kos, penghantaran, dan fleksibiliti. Ada juga sejumlah besar penyelidik yang memakai ukuran lain seperti masa, sumber daya manusia, kewangan, kepuasan pelanggan, pembaharuan, dan kecekapan. Sangat sedikit penyelidik yang membangunkan pengukuran prestasi perkilangan untuk industri kecil dan sederhana. Berdasarkan tinjauan literatur terhadap kajian terdahulu, kajian ini mencadangkan sekumpulan ukuran prestasi perkilangan untuk industri kecil dan sederhana, yang terdiri dari kualiti, penghantaran, kos, fleksibiliti, masa, dan buruh, yang mana merupakan ukuran umum yang dipakai dalam kajian-kajian yang dahulu. Sejumlah 32 elemen ukuran telah diperolehi dari literatur yang berkaitan. Satu kajian soal selidik telah dijalankan untuk membandingkan ukuran tersebut dengan amalan industri. Didapati sejumlah besar ukuran diaplikasikan oleh industri kecil dan sederhana automotif di Malaysia. Kualiti dan kos menunjukkan penggunaan yang paling kerap, diikuti dengan penghantaran dan masa juga pada tingkat penggunaan tinggi. Walau bagaimanapun, buruh dan fleksibiliti ditempatkan pada tingkat penggunaan rendah. Akhirnya, sejumlah 25 ukuran telah dicadangkan untuk menentukan prestasi perkilangan dalam industri kecil dan sederhana. Kaedah AHP telah diaplikasikan dalam membangunkan suatu alat bagi mengukur prestasi perkilangan untuk industri kecil dan sederhana. Alat ini membolehkan dan membantu industri kecil dan sederhana dalam usaha mereka untuk memperbaiki prestasi perkilangan secara berterusan supaya menjadi lebih efisien dan efektif. Walaupun alat ini menyediakan suatu pendekatan sistematik untuk penentuan kuantitatif prestasi perkilangan, namun ia tidak sepenuhnya automatik. Oleh itu, satu perisian berdasarkan alat ini telah dibangunkan dengan menggunakan PHP dan MySQL. Dua kajian kes telah diadakan untuk mengesahkan alat ini. Keputusan daripada kajian kes ini mencadangkan alat ini adalah tepat dan sesuai digunakan untuk menentukan prestasi perkilangan dalam industri kecil dan sederhana. Alat ini mengenal pasti kekuatan dan kelemahan yang menunjukkan di mana dan bagaimana pembaharuan perlu dilakukan. Alat ini menyediakan arah untuk mempraktikkan pembaharuan secara berterusan dan kearah kecemerlangan.

# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 Background of the Research**

Small and medium-sized enterprises (SMEs) have been heralded as a vital group in gaining and maintaining national competitive advantage worldwide especially in the development of a knowledge economy by providing a route for the creation of employment and the generation of wealth in the twenty first century.

The globalization of markets, growing inter-diffusion of economies, and increased inter-dependence of economic agents are reshaping national and international competitive environment and economic performance (Ghobadian and Gallar, 1996). Competitive pressures in global manufacturing are forcing manufacturing organizations to re-examine and modify their competitive strategies. Small and medium sized enterprises (SMEs) are not exempted from these pressures. They have to pay more attention to the changes in manufacturing performance system including the measures used. They need to have a set of manufacturing performance measure to gauge their level of achievement.

Hudson (2001) suggested that there are numerous barriers to strategic performance measurement system implementation in SMEs. The failure of the implementation was attributed primarily to the development process being: too resource intensive and too strategically oriented. This concurs with the limited

resources and the more dynamic, emergent, strategy styles found in SMEs. These issues are acutely problematic because developing a strategic performance measurement system is necessarily long term and it explicitly requires the resulting measures to be strategically focused. The significant differences in the structure and philosophy of SMEs indicate that there is a need to assess the relevance of the strategic performance measurement.

The last twenty years has witnessed a revolution in performance measurement (Neely and Bourne, 2000). This revolution has been driven by changes in the business environment, which has led to the recognition that conventional measures do not present a complete picture of organizational performance, hence the development of critical measures (Stone and Banks, 1997).

According to Ghalayini and Noble (1996), the literature concerning performance measurement has evolved through two phases. The first phase started in the late 1880s which is characterized by its cost accounting orientation. This orientation aimed at aiding managers in evaluating the relevant costs of operating their firms. It was later modified in an attempt to incorporate some financial measures such as profit and return on investment. However, even with somewhat of a financial focus, this approach received considerable criticisms. Critics argued against focusing solely on financial measures, when measuring performance tends to encourage short-term thinking (Kaplan, 1983). This argument was further reinforced on the grounds that traditional financially-based performance measurement systems failed to measure and integrate all the factors critical to business success (Kaplan, 1984).

The mid-1980's was a turning point in the performance measurement literature, as it marked the beginning of the second phase. This phase was associated with the growth of global business activities and the changes brought about by such growth. Johnson and Kaplan (1987) underscored the need for better integrated performance measurement, as they criticized the traditional performance measures, due to their focus on the minimization of variance rather than on continuous improvement. The authors contended that traditional financial measurement systems are, for the most part, irrelevant because they ignore customers and their needs.

Based on similar grounds, McNair and Mosconi (1987) called for the development of better integrated performance measurement systems. They underscored the need for the alignment of financial and non-financial measures in order to be in accordance with business strategy.

Current studies have showed that quality, cost, delivery and flexibility are the commonly cited performance measures relating to competitive priorities (White, 1996; Small, 1999; Medori and Steeple, 2000; Toni and Tonchia, 2001; Yurdakul, 2002; Christiansen et al., 2003; Fynes et al., 2005; Neely et al., 2005; Diaz et al., 2005; Tarigan, 2005; Cua et al., 2006; Meybodi, 2006; Liao and Qiang Tu, 2008; Ahuja and Khamba, 2008). Time and labor are also considered to be a critical measure of performance measurement (Small, 1999; Mapes et al., 2000; Hudson et al., 2001; Toni and Tonchia, 2001; Najmi and Kehoe, 2001; Yurdakul, 2002; Abdel-Maksoud, 2004; Neely et al., 2005; Gosselin, 2005; Meybodi, 2006; Gomes et al., 2007; Ahuja and Khamba, 2008).

Other measures are also used to measure manufacturing performance such as customer satisfaction, finance, innovation and efficiency (Mapes et al., 2000; Hudson et al., 2001; Najmi and Kehoe, 2001; Abdel-Maksoud, 2004; Narasimhan et al., 2005; Gosselin, 2005; Gomes et al., 2007; Liao and Qiang Tu, 2008).

## **1.2 Statement of the Problem**

Manufacturing performance measures are needed for manufacturing organizations to achieve their goals and objectives. Companies need to determine the performance measures to evaluate, control, and improve production process by measuring manufacturing performance.

Although manufacturing performance measurement has been in existence for many years, it seems that there is no consensus on the collective set of measures used by companies. Most researchers and authors defined the manufacturing performance measures in terms of quality, cost, delivery and flexibility. There is also a bulk of

researches that used other measures such as time, human resource, financial, customer satisfaction, innovation, and efficiency. Very few researches have developed to the manufacturing performance measurement for SMEs.

It is believed that there is a need for assessing manufacturing performance for SMEs, which suitable and useful to their characteristics. The focus of this research is to develop a tool to assess manufacturing performance for SMEs, which hopefully will help them to keep track of their performance.

### **1.3 Objectives of the Study**

The objectives of this study:

- a. To formulate a set of manufacturing performance measures for SMEs.
- b. To develop a tool to assess manufacturing performance for SMEs.

### **1.4 Scopes of the Study**

The scopes of this study:

- a. The focus of this research is the Small and Medium-sized Enterprises (SMEs), limited to Malaysian automotive component part manufacturers.
- b. The manufacturing performance measures were used in this research derived from the literature review, focused on quality, cost, delivery, time, flexibility, and labor.
- c. The manufacturing performance measurement tool was developed by using Analytic Hierarchy Process (AHP) methodology.
- d. A software-based tool was developed by using PHP and MySQL.

## **1.5 Importance of the Study**

The research on the development of a tool to assess manufacturing performance for SMEs is very important and useful, particularly in a competing environment. A set of manufacturing performance measures for SMEs is expected to be suitable to their characteristics and improve their competitiveness. The measures are then used in developing a tool to assess manufacturing performance for SMEs.

The manufacturing performance measurement tool for SMEs enables and assists in their efforts to continually improve their manufacturing performance so as to become more efficient and effective. The tool can also be used to compare the manufacturing performance of different companies, plants, and departments. Besides that, the tool can be used for supplier selection and evaluation to achieve a certain level of manufacturing performance to ensure the suppliers have good manufacturing performance and good support to the manufacturing. In this case, the company can select suitable and appropriate suppliers that meet their criteria.

## **1.6 Layout of the Thesis**

This report consists of seven chapters. The first chapter provides an introduction to the research. It describes the background of the research, statement of the problem, objectives, scopes, and importance of the study. Chapter 2 presents a critical review of Small and Medium-sized Enterprises (SMEs) including the definition of SMEs in selected economies, importance of SMEs, and differences of SMEs and large companies; manufacturing performance measurement including definition of performance measurement, manufacturing performance revolution, and a review on previous manufacturing performance measures; identified manufacturing performance measures for SMEs; and Analytic Hierarchy Process (AHP) methodology.

The research methodology employed in conducting this study is described in Chapter 3. The research begins with identifying a set of manufacturing performance

measures for SMEs derived from the literature. A survey was then conducted to match the measures with industry practices. A questionnaire was designed to investigate the measures being practiced and those believed to be useful in SMEs. The next step is developing a tool to assess manufacturing performance for SMEs. The tool was validated by conducting case study to selected SMEs.

Chapter 4 presents the survey results and analysis. The survey has investigated the manufacturing performance measures being practiced and the level of usefulness in SMEs. Data from the survey was analyzed and a set of manufacturing performance measures for SMEs was proposed which hopefully are suitable to their characteristics.

The development of manufacturing performance measurement tool for SMEs is described in Chapter 5. The tool was developed using Analytic Hierarchy Process (AHP) methodology. A software-based tool was subsequently developed for automating the process. It is a web based-software developed using PHP and MySQL. Chapter 6 presents the validation of manufacturing performance measurement tool for SMEs. The developed tool was validated by conducting two case studies in Malaysian automotive SMEs.

Finally, the discussion of the previous chapters is provided in Chapter 7. To cover all the activities in this study, some conclusions are presented and some recommendations are proposed for further improvement.
