MASTER DATA MANAGEMENT ADOPTION MODEL IN
MALAYSIA LOCAL GOVERNMENT

FAIZURA HANEEM BINTI MOHAMED ALI

A thesis submitted in fulfilment of the
requirements for the award of the degree of
Doctor of Philosophy

Razak Faculty of Technology and Informatics
Universiti Teknologi Malaysia

FEBRUARY 2019

DEDICATION

Alhamdulillah

This thesis is dedicated to:

My beloved parents Mohamed Ali and Rahila Haneem

My beloved parents-in-law Basri and Warniah

My other half Muhammad Sufyan bin Basri and all my lovely children

For their endless encouragement, support and sacrifice which I owe them my all.

ACKNOWLEDGEMENT

First and foremost, all praises are due to Allah, the Most Gracious and the Most Merciful. I am most thankful to Him for His blessings in the completion of this thesis. I would like to express my deepest gratitude and love to my family, especially my husband, children, parents, and parents-in-law. Their patience, understanding, and endless support gave me strength and inspiration to finish my thesis.

I am particularly grateful to my supervisor; Assoc. Prof. Dr. Mohd Nazri Kama for his kindness, commitment, expert guidance, motivation and financial support throughout my Ph.D. journey. Special thanks are due to my late co-supervisor Dr. Rosmah Ali for the guidance and knowledge she shared until the end of her life. Remembering her wonderful and gentle soul will forever remain in my heart, may she rest in peace.

I also acknowledge Dr. Nazim Taskin and Prof. David Pauleen for their guidance and inputs to this research throughout my research internship in Massey University. I am deeply indebted to Prof. Ramayah for his passion in guiding me throughout the development of the conceptual model, instrument development and data analysis using PLS-SEM. The highest appreciation goes to all the experts for their involvement in giving their insightful inputs to my research, especially to En. Azih Yusof, Pn. Nik Zalbiha, Pn. Norazah Latif, Pn. Siti Nurliza and Pn. Rapih Ibrahim from Malaysian Public Sector. Also, special thanks to the local government respondents who have been very cooperative throughout my data collection.

Finally, without naming them, I thank all my friends and everybody who helped me directly or indirectly throughout my research journey.

ABSTRACT

Master Data Management (MDM) is an approach for effective management of shared master data across organizations. MDM consolidates and integrates master data from multiple organizations to the central platform and publishes the centralized data to the authorized applications across different organizations. In the Malaysian public sector, few MDM initiatives have been developed, however, the adoption by local government remains slow. In addition, there have been limited studies on the MDM adoption. Hence, research is needed to investigate determinants that influence the MDM adoption by local government. This research aims to develop a model of determinants that influence the MDM adoption by local government. The research started with the identification of problem and knowledge gaps by reviewing existing MDM literature and MDM adoption reports in Malaysia. Then, two Systematic Literature Review (SLR) were conducted to identify potential determinants influencing the MDM adoption by local government. Based on the SLR results and with the underpinning theory of Technology-Organization-Environment framework, Diffusion of Innovation and Fit-Viability Model, a conceptual model was developed and verified by five experts. Next, a survey instrument was developed through content validity test with eleven experts and was pilot test with 30 respondents. Subsequently, data collection was conducted from local government department units in Malaysia and 224 responses were analysed to validate the conceptual model using Partial Least Square-Structured Equation Modelling analysis. The model validation revealed that six determinants of technological (complexity, quality of master data), organizational (data governance, top management support, technology competence) and environmental (citizen demand) have significant effects on MDM adoption by Malaysian local government, with p -value < 0.05 . Surprisingly, three determinants of technological (relative advantage, data security) and environmental (government policy) are found to have non-significant effects on the adoption of MDM by local government with p -value > 0.05 . In addition, top management support appeared as a cornerstone of MDM technological competence, with p -value < 0.05 . Moreover, this research also confirmed the positive relationship between citizen demand and MDM adoption by Malaysian local government will be stronger when citizen population density is high, with $p < 0.01$ and the moderating effect of 0.1. To evaluate the developed model, a set of guidelines and strategy of MDM adoption for the Malaysian public sector were then developed and reviewed by MDM practitioners. Overall, this research contributes to the theoretical, contextual and practical knowledge of MDM and information technology adoption in the context of local government.

ABSTRAK

Pengurusan Data Induk (MDM) merupakan pendekatan bagi pemusatan dan perkongsian data merentas pelbagai organisasi. MDM mengumpul dan mengintegrasikan data-data induk daripada pelbagai organisasi ke platform pusat dan menawarkan data berpusat tersebut kepada aplikasi-aplikasi yang dibenarkan di pelbagai organisasi. Dalam sektor awam Malaysia, walaupun beberapa inisiatif MDM telah berjaya dibangunkan, namun kadar penerimgunaan oleh kerajaan tempatan menunjukkan kadar yang sangat perlahan. Tambahan pula, kajian tentang penerimgunaan MDM adalah terhad. Oleh itu, kajian untuk menyelidik penentu yang mempengaruhi penerimgunaan MDM oleh kerajaan tempatan amat diperlukan. Kajian ini bertujuan untuk membangunkan model bagi penentu yang mempengaruhi penerimgunaan MDM oleh kerajaan tempatan. Kajian ini dimulakan dengan penyataan masalah dan jurang pengetahuan dengan mengkaji kajian MDM terdahulu dan laporan-laporan penerimgunaan MDM di Malaysia. Kemudian, dua Sorotan Kajian yang Sistematis (SLR) telah dijalankan untuk mengenal pasti penentu yang mempengaruhi penerimgunaan MDM oleh kerajaan tempatan. Berdasarkan hasil SLR dan penggunaan teori kerangka kerja Teknologi-Organisasi-Persekitaran (TOE), Penyebarluasan Pembaharuan (DOI) dan Model Kebolehhidupan-Berpadan, model konseptual kajian telah dibangunkan dan disemak oleh lima orang pakar. Kemudian, instrumen soal selidik telah dibangunkan melalui ujian pengesahan kandungan oleh sebelas orang pakar dan ujian rintis bersama 30 orang responden. Setelah itu, pengumpulan data dilaksanakan ke atas pihak berkuasa tempatan di Malaysia dan 224 maklum balas telah dianalisis untuk mengesahkan model konseptual menggunakan Pemodelan Persamaan Berstruktur-Kuasa Dua Terkecil Separa. Pengesahan model mendapati bahawa enam penentu teknologi (kompleksiti, kualiti data induk), organisasi (tadbir urus data, sokongan pengurusan atasan, kecekapan teknologi) dan persekitaran (permintaan rakyat) mempunyai kesan yang signifikan ke atas penerimgunaan MDM oleh kerajaan tempatan Malaysia, dengan nilai $p < 0.05$. Manakala, tiga penentu, iaitu teknologi (kelebihan relatif, keselamatan data) dan persekitaran (dasar kerajaan) didapati mempunyai kesan tidak signifikan ke atas penerimgunaan MDM oleh kerajaan tempatan Malaysia dengan nilai $p > 0.05$. Di samping itu, sokongan pengurusan atasan dinyatakan sebagai asas kecekapan teknologi MDM, dengan nilai $p < 0.05$. Selain itu, kajian ini juga mengesahkan hubungan positif antara permintaan rakyat dengan penerimgunaan MDM oleh kerajaan tempatan Malaysia akan menjadi lebih kuat apabila ketumpatan populasi rakyat adalah tinggi, dengan $p < 0.01$ dan kesan moderasi sebanyak 0.1. Untuk menilai model yang telah dibangunkan, satu set garis panduan dan strategi penerimgunaan MDM untuk sektor awam Malaysia telah dibangunkan dan disemak oleh pengamal MDM. Keseluruhannya, kajian ini memberi sumbangan kepada teori, konteks, dan praktikal tentang penerimgunaan MDM dan Teknologi Maklumat dalam konteks kerajaan tempatan di negara membangun.

CHAPTER 1

INTRODUCTION

1.1 Overview

Recently, the volume of data in most organizations has increased dramatically due to the use of advanced technology to capture data in various formats. Most of the existing structured data formats can be classified into master data, transactional data, metadata, history data, and queue data. Among these categories, master data are the highest priority data to be managed. Master data contain valuable information about the organization (Nelke *et al.*, 2015). In the public sector, master data consist of core information of the organization, such as customer profiles, services and products, and service provider profiles. Usually, each government organization has its own master data stored in the database in silos and hard-coded in the integration layer for data exchange (Bonnet, 2013). This situation leads to the duplication of master data across various government organizations, which may negatively affect the organizations due to higher costs and data management complexity.

Therefore, one of the government initiatives to reduce the data duplication, increase data quality, enable broader data integration, and eliminate redundant integration activities is the establishment of Master Data Management (MDM) (Buffenoir & Bourdon, 2012; Gomedé & Barros, 2013; Loshin, 2009; Shin, 2006). MDM involves identifying, consolidating, and integrating master data from multiple data sources from different organizations into central data repository (Anand *et al.*, 2014; Baghi, Schlosser, Ebner, Otto, & Oesterle, 2014). Using MDM, master data from multiple organizations, which potentially are valuable across government organizations are identified and consolidated in a central repository. This repository is served as a ‘single source of truth’ by many applications across organizations (Anand *et al.*, 2014; Baghi *et al.*, 2014; Spruit & Pietzka, 2014). Thus, government agencies do not need to capture and manage same master data in their own environment. They

can refer to the central repository that provides highly accurate and easily accessible information about citizens, organizations, employees, programs, and services as required by many government organizations for decision making and other government programs.

Relatively in the Malaysian public sector, several MDM initiatives have been established. However, the adoption rate by the Malaysian government organizations in sharing their master data to the MDM central data repository indicates a very slow progress, particularly by Malaysia local government. The slow adoption of the MDM possibly is due to the critical challenges that the organizations may expose during the adoption of MDM such as technological, organizational, and environmental challenges (Berson & Dubov, 2011; Haug, Arlbjorn, Zachariassen, & Schlichter, 2013; Silvola, Risto, Jaaskelainen, Kropsu-Vehkaperä, & Haapasalo, 2011). Therefore, this research aims to develop, validate and evaluate a new model of determinants that influence the MDM adoption by Malaysia local government in order to understand what facilitates local government organizations in Malaysia to adopt MDM initiatives.

This chapter gives an overview and introduction of this thesis. First, the chapter provides a research background (Section 1.2, page 2) including the background of MDM, Malaysia local government, and MDM adoption scenario by Malaysia local government organizations. Second, it introduces the problem background (Section 1.3, page 13) and states the problem of the research (Section 1.4, page 15). Third, it then highlights research questions (Section 1.5, page 16) and research objectives (Section 1.6, page 17). Fourth, it outlines the significance of the research (Section 1.7, page 17) and the scope of the research (Section 1.8, page 20). Finally, the chapter describes the structure of the thesis content (Section 1.9, page 22).

1.2 Background of the Research

This section explains the research background, in particular, MDM background (Section 1.2.1, page 3) which include MDM in the body of the knowledge, the implementation of MDM in public sector, and MDM in the Malaysian Government

Online Services Gateway model. In addition, the section describes the Malaysia local government environment (Section 1.2.1, page 3).

1.2.1 Master Data Management (MDM)

According to the Data Management Body of Knowledge (DMBOK) by Data Management Association (DAMA), MDM is classified as one of the data management key functions (DAMA, 2009), which refers to the overall management of shared data across disparate business units or organizations. Figure 1.1 shows the MDM position in DMBOK (DAMA, 2009). MDM is not just a technology; it comprises technology, people, and processes to create, maintain and manage the master data at a central level (Dreibelbis *et al.*, 2008). MDM is an emerging Information Systems (IS) research topic which experiencing a hype phenomenon similar to other technologies, such as Enterprise Resource Planning (ERP) and Data Warehouses (Scheidl, 2011).

Figure 1.1 MDM in DMBOK (DAMA, 2009)

Technology Priority Matrix of Hype Cycle for Enterprise Information Management by Gartner (2015) stated that the MDM implementation gives a high benefit to the organization. Figure 1.2 depicts the Technology Priority Matrix of Hype Cycle for Enterprise Information Management. It is noteworthy that the organization commonly requires from five to ten years to adopt MDM after the technology being introduced.

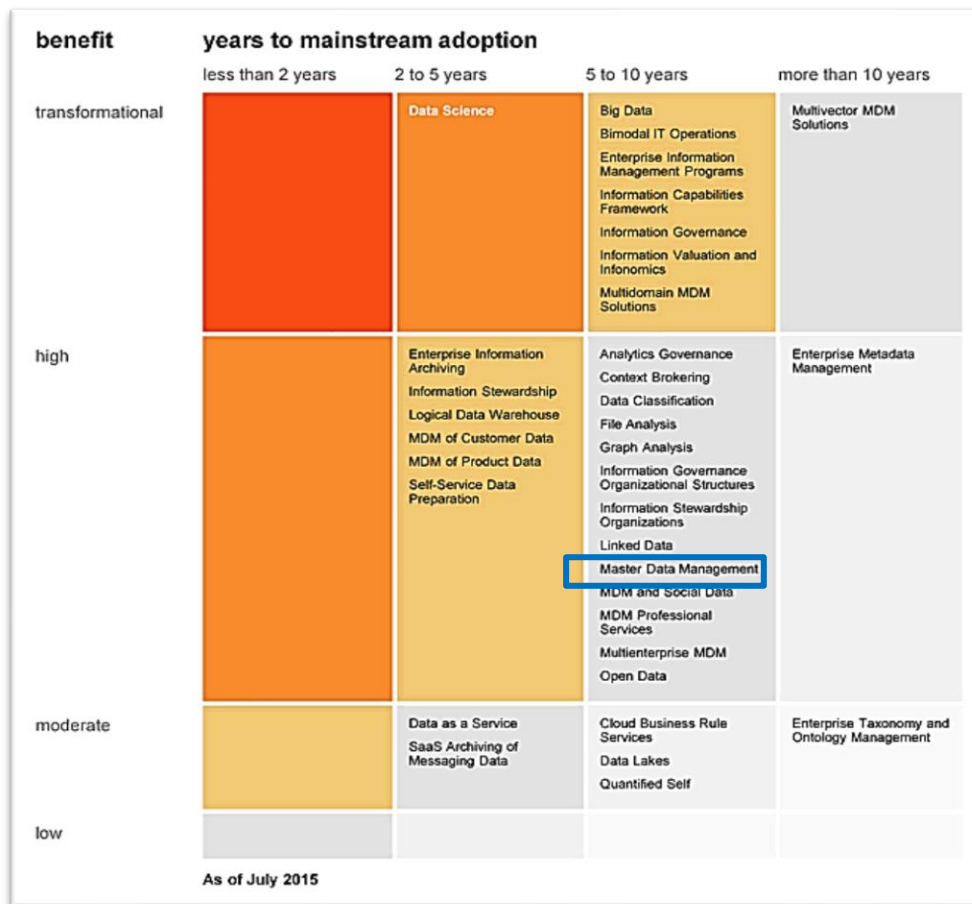

Figure 1.2 MDM in Technology Priority Matrix (Gartner, 2015)

The important role of MDM has been acknowledged when the amount of data has promptly increased, and they are often managed independently in various systems and databases. Many organizations stored the same master data in their various systems and database. This situation leads to data quality problems such as duplication, inaccuracy, and incompleteness (Smith & McKeen, 2008). With MDM that serve as ‘single reference of truth’, the benefits of the implementation is inevitable. Shin (2006) argued that MDM implementation would give four major advantages to the organisation such as; 1) improve the organisation’s ability to adjust to the rapidly changing business requirements, 2) improve the operational efficiency by streamlining the business processes and improving the data quality, 3) improving information management efficiency by enabling broader and more complex data integration, eliminating redundant data management practices and eliminating redundant integration activities, and 4) improve decision-making by enabling data quality improvements and simplifying data integration.

Realizing the advantages of MDM, several MDM initiatives have been developed in public sector to achieve the highest level of e-government, i.e. horizontal integration. According to Layne and Lee (2001), e-government initiatives should be derived and implemented based on four stages: cataloguing, transaction, vertical integration, and horizontal integration. The highest stage of e-government can only be accomplished by horizontally integrating government services across different functions, such as business units and organizations. Thus, data from different databases will be shared across the public sector, so that information obtained by one organization will circulate throughout all government functions. To achieve the highest level of e-government, the public sector in developed countries have established various MDM initiatives, such as Australian Business Licence and Information Service (<https://ablis.business.gov.au>), New Zealand Education Services Single Windows (<http://services.education.govt.nz>), and Health Patient Single Portal (<https://www.health.govt.nz/our-work/ehealth/other-ehealth-initiatives/patient-portals>), among others. MDM is established in the UK Public Sector, in which the National Health Service has funded an MDM project in 2016 to encourage data connection across various related organizations within healthcare domain (Mathieson, 2017).

Being a developing country, with a significant progress made in the development and utilization of various Information and Communication Technology (ICT) agendas, Malaysia highly supports the MDM initiatives. This is shown in the Malaysian Government Online Services Gateway Model (MAMPU, 2016a) initiated by the Malaysian Administrative Modernisation and Management Planning Unit (MAMPU) acting as a leading agency for public sector's transformation, through the ICT best practices. The MDM has been positioned in the heart of the Malaysian Government Online Services Gateway model (MAMPU, 2016a) to allow horizontal information sharing and integration across multiple organizations. Master data centralization and integration from various sources takes place through data sharing between data provider organizations (e.g. central, state, and local government) and MDM repositories. The centralized master data in MDM are consumed by multiple data consumers' applications (e.g. business, education, and health clusters) through data brokers for the establishment of government online services. Figure 1.3 presents

the elements of the Malaysian Government Online Services Gateway model (MAMPU, 2016a).

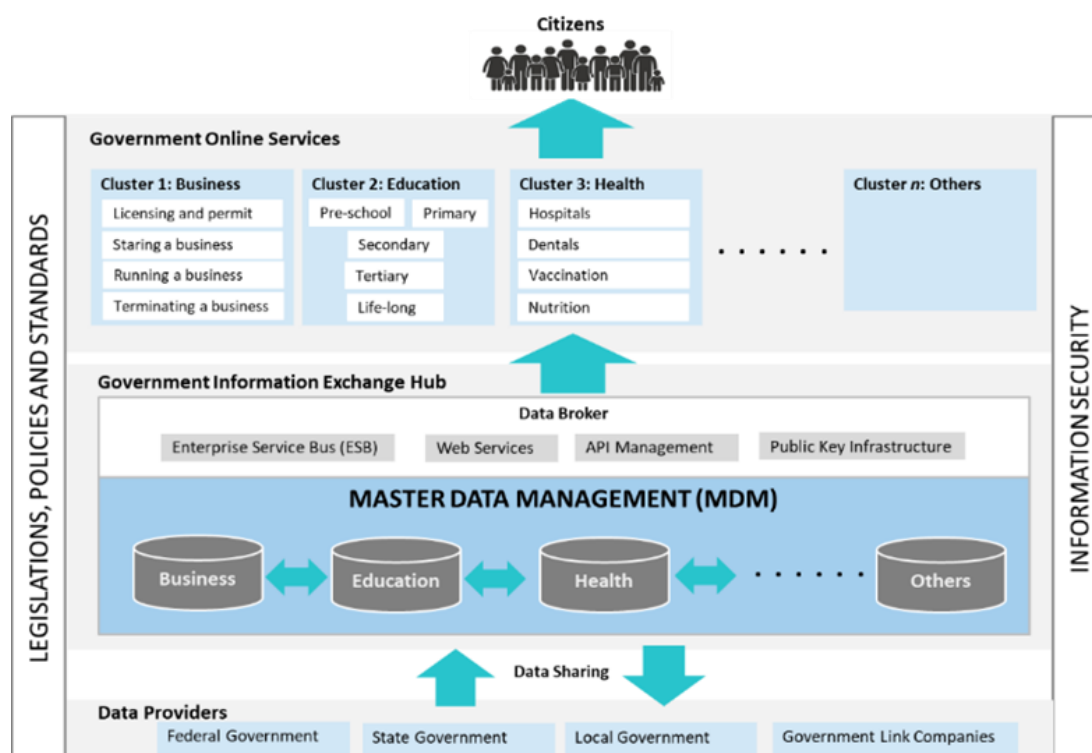

Figure 1.3 Malaysian Government Online Services Gateway Model (MAMPU 2016a)

Previous MDM initiatives, namely Business Licensing Electronic Support System (BLESS) and Electronic Pihak Berkuasa Tempatan (ePBT) have been developed in Malaysian public sector involving the local government as the main data provider. BLESS is an MDM initiative developed for the business cluster by the Malaysian Implementation Coordination Unit in 2008, which aims to provide a one-stop center for firms or individuals to apply for business licenses in Malaysia (ICU, 2017). Master data for business licensing information from licensor agencies are consolidated into BLESS to facilitate services, wherein any application and inquiry from the citizen about business licensing can be made via a single portal. On the other hand, ePBT is an MDM initiative developed by the Ministry of Urban Wellbeing, Housing and Local Government of Malaysia in 2007 to consolidate data about accounts, taxation, application submission and complaints services from Malaysia local government organizations (KPKT, 2017b). The ePBT aims to simplify the

processes for citizens by providing a single access to online services across local government in Malaysia. Master data from participating local government are consolidated into the ePBT so that any inquiry, application, and complaint from the citizen can be made via a single access.

1.2.2 Malaysia Local Government

Local government is one of the organizations in the public owned and run by the government besides federal, provincial and state. In the Malaysian public sector, local government organizations play an important role as data providers to the MDM initiatives. Malaysia local government is responsible for serving the Malaysians on public utilities, enforcement, businesses licensing, public health, cleaning and waste management, social services and development, and environmental issues. In Malaysian context, local government also known as local authority, is the lowest level of public administration within a specific state (United Nations, 2005). Malaysia has a total landmass of 330,803 square kilometers, separated by the South China Sea into two similarly sized regions, namely Peninsular Malaysia, and East Malaysia including Sabah and Sarawak. Currently, there is a total of 155 Malaysia local government organizations which include 13 city councils, 39 municipal councils, 97 district councils and 6 special councils (Johor State Government 2017, KPKT Selected Statistics 2015). City councils typically have more than 500,000 people, municipality councils have between 150,000 and 500,000 people, and district and special councils have less than 150,000 people. Table 1.1 presents the number of local government organizations in each Malaysian state, based on city, municipality, district, and special council.

Table 1.1 Number of local government organizations in Malaysia

State	City Council	Municipality Council	District Council	Special council	Total
Johor	1	6	8	2	17
Kedah	1	3	7	1	12
Kelantan	0	1	11	0	12
Malacca	1	3	0	0	4
Negeri Sembilan	0	3	5	0	8
Pahang	0	3	8	1	12
Penang	1	1	0	0	2
Perak	1	4	10	0	15
Perlis	0	1	0	0	1
Terengganu	1	2	4	0	7
Selangor	2	6	4	0	12
Sabah	1	2	21	0	24
Sarawak	3	3	20	0	26
W.P Kuala Lumpur	1	0	0	0	1
W.P Labuan	0	0	0	1	1
W.P Putrajaya	0	0	0	1	1
Total	13	39	97	6	155

Malaysia local government organizations are defined according to Local Government Act 1976 for Peninsular Malaysia, Local Governments Ordinance 1996 for the state of Sarawak, and Local Government Ordinance 1961 for the state of Sabah. For Peninsular Malaysia, local government refers to “any City Council, Municipal

Council or District Council, whereas the Federal Territory refers to the Commissioner of the City of Kuala Lumpur appointed under section 4 of the Federal Capital Act 1960 [Act 190]” (Malaysia, 1976). Local government in Sarawak refers to “(a) a City Administration as identified in Part I of the First Schedule; (b) a Municipal Council as identified in Part II of the First Schedule; and (c) a District Council as identified in Part III of the First Schedule; Bintulu Development Authority has been inserted in the above-mentioned sub-section (b)” (Malaysia, 1996). While local government in Sabah refers “any District Council, Town Board or Municipal Council established under the provisions of Section 3” (Malaysia, 1961). The distribution of local government locations on Malaysia’s map is presented in Figure 1.4. The full list of 155 Malaysia local government organizations by state is presented in Appendix A.

Malaysia local government organizations in each state are generally under the purview of the state government and are also subjected to the purview of Ministry of Urban Wellbeing, Housing, and Local Government. In contrast, three local government organizations in federal territories are exclusively subjected to the purview of Ministry of Rural and Regional Development. Figure 1.5 shows the reporting structure of local government organizations in Malaysia. With regards to the core businesses, Malaysia local government typically consists of four core functions in their organizations: corporate management, town planning and development, engineering and maintenance, and town service. These core businesses are handled by one or more departments in the organization, depending on the number of citizens in the local government. Corporate management involves human resource management, valuation and financial, information management, corporate planning and administration matters. Town planning is responsible for city planning, building control, infrastructure planning and economic planning. Engineering and maintenance include engineering, project implementation, landscape and quantity surveying. Town service comprises of enforcement, business licensing and petty traders, health and environment, culture and tourism.

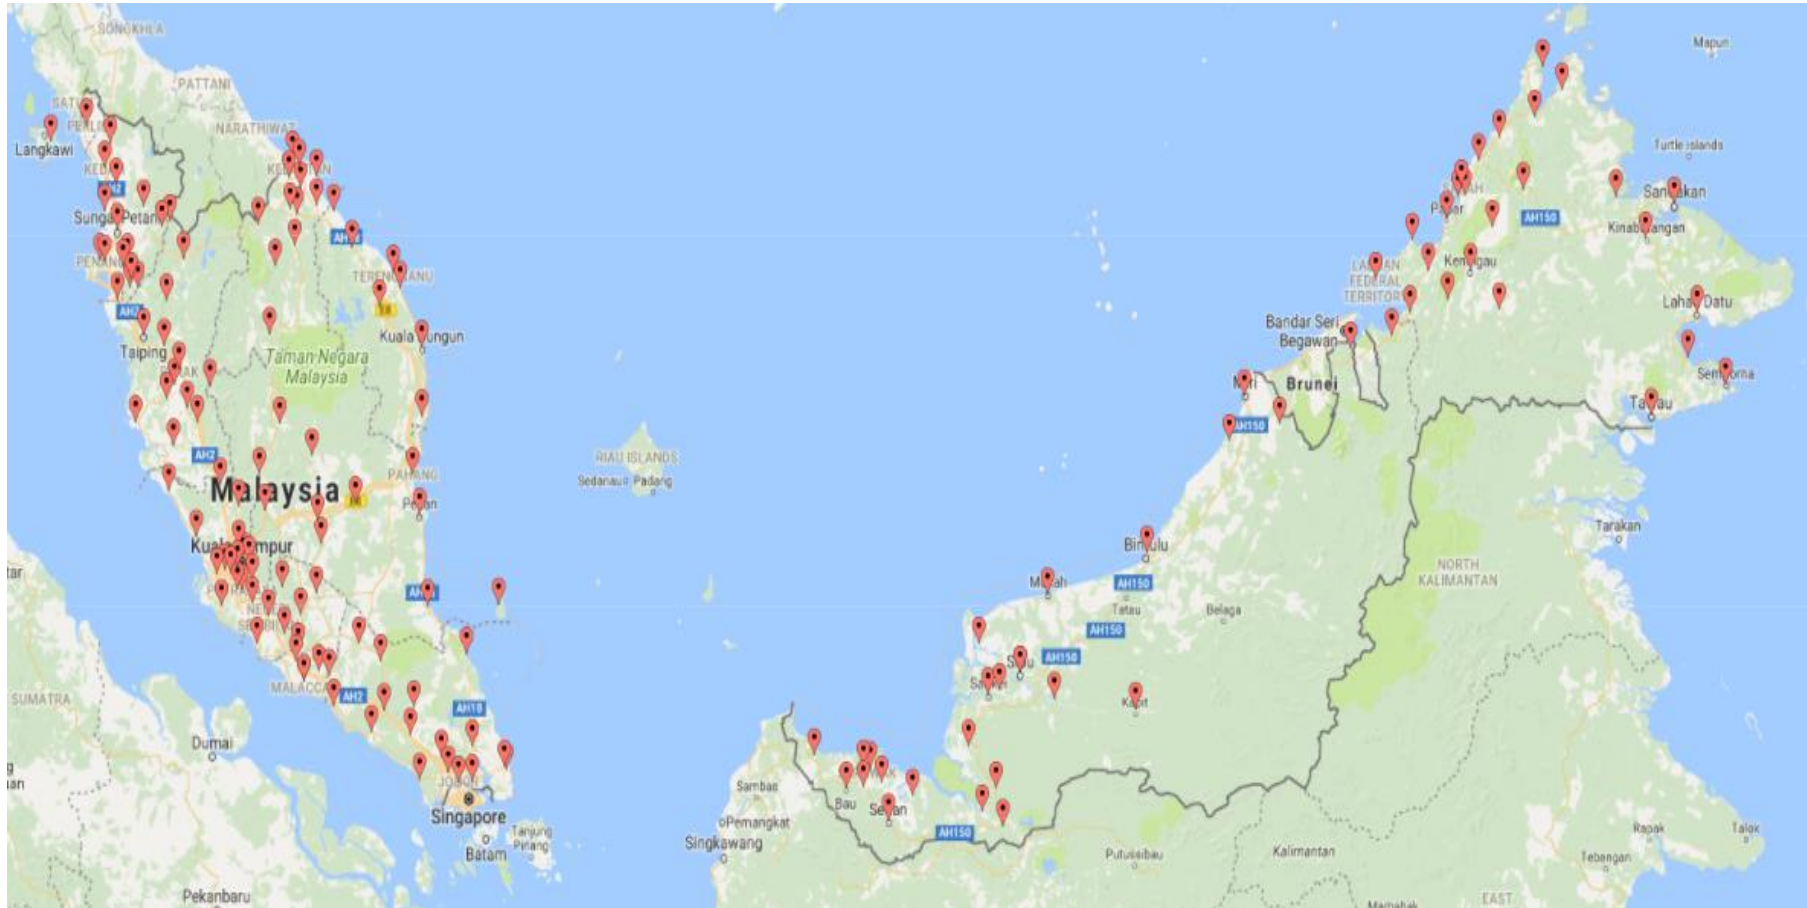

Figure 1.4 Distribution of Malaysia local government organizations on Malaysia's map

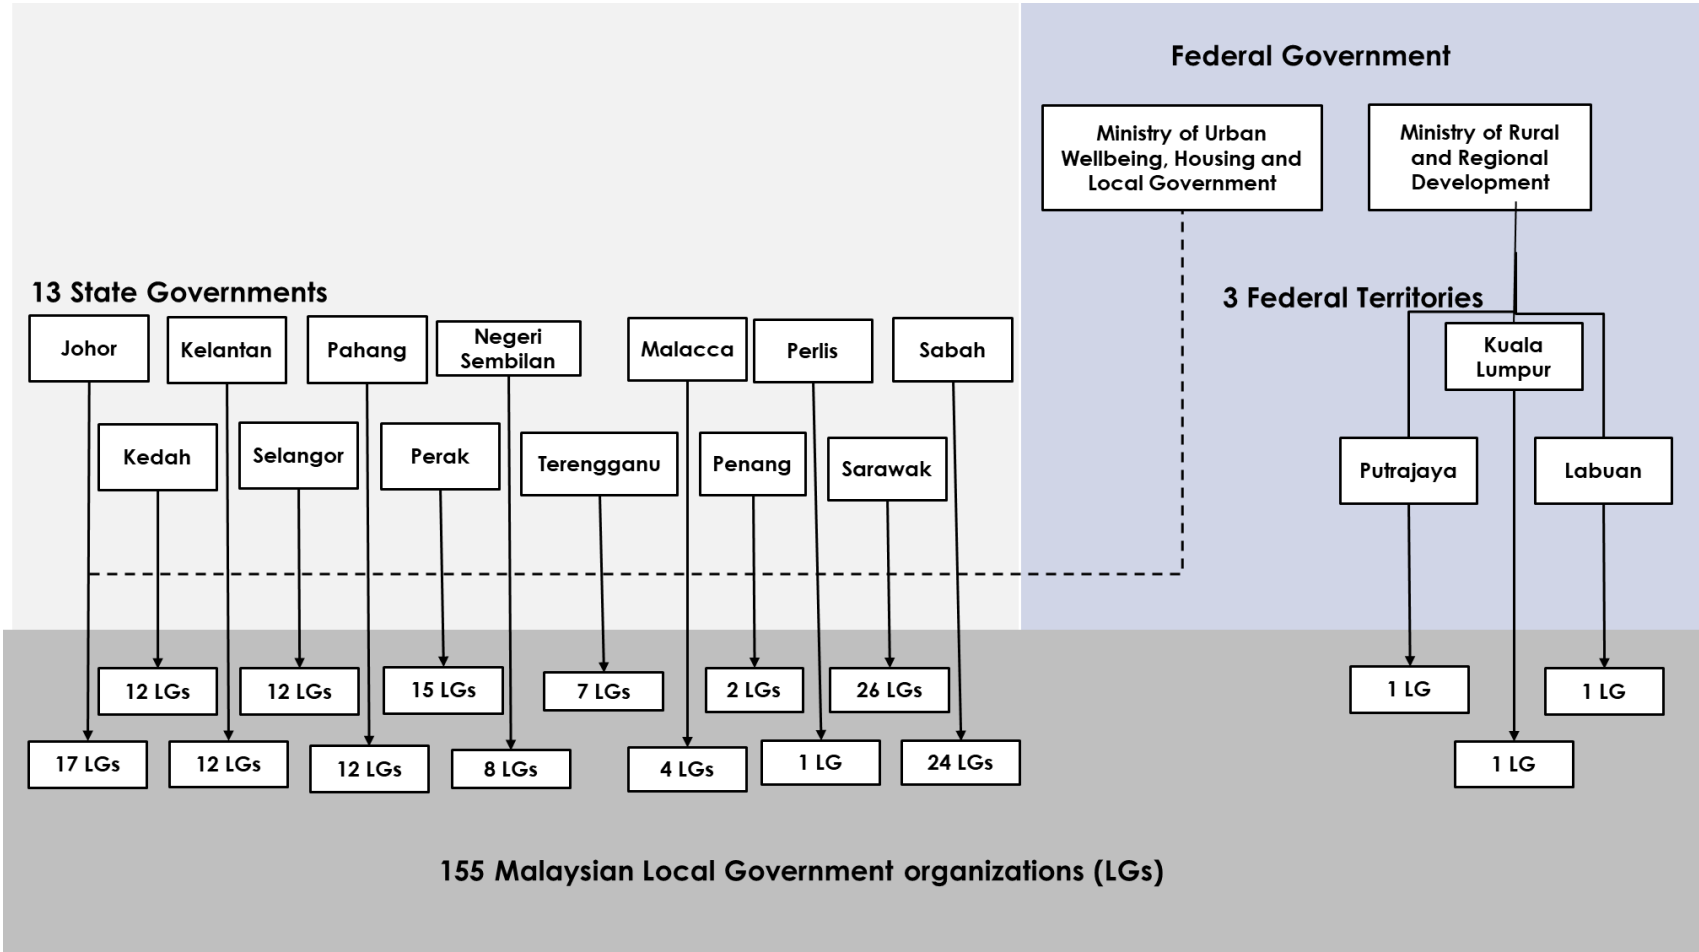

Figure 1.5 Reporting structure of Malaysia local government

Malaysian population density is measured by three levels: low, medium, and high, depending on the number of the citizen served by each local government organization (McCullough *et al.*, 2015; Rubin *et al.*, 2014). With regards to the citizen proportion of the Malaysia local government organizations, this research classified a citizen density of Malaysia local government into ‘low’ when less than 100,000 people, ‘medium’ when it is between 100,000 to 3000,000 people, and ‘high’ when more than 3000,000 people served by the local government. The number of citizen served by each local government in Malaysia is retrieved from the electronic data bank of Department of Statistics, Malaysia (DOSM, 2010). Table 1.2 outlines the number of Malaysia local government organizations based on high, medium, and low population density.

Table 1.2 Citizen population density of Malaysia local government

Citizen population density	Number of Malaysia local government organizations
High (more than 3000,000 people)	23 organizations
Medium (100,000 – 3000,000 people)	51 organizations
Low (less than 100,000 people)	81 organizations
Total	155 organizations

As organizations that directly deal with citizens, local government organizations own significant valuable master data which can be shared across government agencies, including citizen profile, business registration and licensing, and town development plan. Hence, the adoption of MDM by Malaysia local government organizations by sharing and providing their master data to the MDM repository is highly important.

1.3 Problem Background

The adoption of MDM by organizations has remained at moderate rate, despite the outward benefits of the MDM (O’Kane, White, Judah, Friedman, & De Simoni, 2014). In Malaysian public sector, although earlier MDM initiatives have been successfully developed, the adoption rate by the government organizations, particularly local government in providing their master data to the MDM, is growing very slowly. After ten years operation of BLESS and ePBT, very few local government organizations have participated in these initiatives, only 3% (ICU, 2009, 2010, 2011, 2012, 2013, 2014, 2015) and 40% (KPKT, 2017b) respectively. This slow adoption might be due to the critical technological, organizational, individual and environmental challenges that the organizations may encounter at the adoption stage of MDM (Berson & Dubov, 2011; Haug *et al.*, 2013; Silvola *et al.*, 2011).

According to Falco and Kleinhans (2018), local government organizations have difficulties in adopting new innovations or digital platforms. Given the slow pace of MDM adoption, the public sector may have difficulty in capturing the value from their investments in the development of strategic information systems i.e. MDM (Rezvani, Dong, & Khosravi, 2017). In addition, the slow rate of MDM adoption by local government affects service delivery to customers, since information and services from different public sector organizations are not seamless (Ndou, 2004). An MDM initiative requires inter-organizational adoption to ensure the successful implementation. Particularly in the public sector, MDM needs the adoption of multiple organizations, such as federal, state, and local governments to provide their master data to the MDM repository. Hence, it is vital to understand the factors that influence the MDM adoption in Malaysia local government context.

Although there has been an increasing interest in MDM research, there has been very little research directly investigating the causal relationship between determinants affecting MDM adoption and proposing definitive MDM adoption model. Results from various previous studies indicate that most of the MDM literature focused on the implementation stage as compared to the adoption stage, which have been examined extensively in the literatures. A number of previous studies include

MDM technical implementation (Baghi *et al.*, 2014; Otto, Hüner, & Österle, 2012; Otto, 2015), implementation approach (Vilminko-Heikkinen & Pekkola, 2013), maturity model (Spruit & Pietzka, 2014), implementation advantages and challenges (Alharbi, 2016; Piedrabuena, González, & Ruggia, 2015) have focused on MDM implementation rather than MDM adoption. Similarly, this trend is also consistent with the review study of e-government initiatives by Rana, Dwivedi, and Williams (2013) which maintained that e-government literature mostly started with the research on implementation and followed by the research on adoption. This is due to the adoption problem only being realized after certain period of time after the technology implementation was introduced. Taking this on board, we can state that as MDM is associated with e-government initiatives, hence, at current stage, further research is necessary to explore e-government adoption at the organizational level (Shareef, Kumar, Kumar, & Dwivedi, 2011).

In addition, there has been lack of quantitative approach in MDM extant research (Haug *et al.*, 2013). Most of the MDM studies are conceptual (Alharbi, 2016; Bonnet, 2013; Dreibelbis *et al.*, 2008; Duff, 2005; Loshin, 2009; Luh, Pan, & Wei, 2008), and qualitative in nature, involving interviews (Baghi *et al.*, 2014), focus groups (Otto *et al.*, 2012; Smith & McKeen, 2008), or case studies (Cleven & Wortmann, 2010; Otto, 2012; Otto & Schmidt, 2010; Silvola *et al.*, 2011; Spruit & Pietzka, 2014; Vilminko-Heikkinen & Pekkola, 2013). A recent study conducted by Vilminko-Heikkinen and Pekkola (2017) has identified the challenges of MDM in public sector, but the study only focused on the implementation stage. Furthermore, even though the context of the study is local government organizations, the study was based on a single qualitative case study. Another study by Alharbi (2016) also highlighted the challenges of MDM implementation, which include data governance, costs, and implementation style, but the findings are conceptual in nature and there was no any empirical work. A study by Haug *et al.* (2013) has outlined barriers to master data quality through MDM implementation. Even though the study has empirically validated with a very large sample, the study only involved 787 Danish manufacturing companies from the private sector, but not the public sector organizations. Thus, more quantitative research is suggested to be conducted to address the methodological gaps in the MDM field.

Particularly in the local government context, although many recent studies on Information Technology (IT) adoption have been carried out, there has been very little focus on MDM adoption. Most of the IT adoption studies investigate the adoption of social media (Anderson, Lewis, & Dedehayir, 2015a; Rubin *et al.*, 2014; Seigler, 2017; Sharif, Troshani, & Davidson, 2015), e-government (Jans *et al.*, 2016; Kamal, Hackney, & Sarwar, 2013; Norris & Reddick, 2013), e-services (Dijkshoorn, 2013; Lagrandeur & Moreau, 2014; Li & Feeney, 2014), and cloud computing (Ali, Soar, & Yong, 2016). This is probably because problems of MDM adoption are only being realized ten years after its establishment. Most of MDM initiatives were established in the years 2004 to 2009, and it takes approximately 5-10 years for an organization to successfully adopt MDM.

Therefore, to deal with the problem of MDM adoption by Malaysia local government and to address the knowledge gaps in MDM literature, it is vital to understand the determinants that influence the MDM adoption by Malaysia local government. The adoption is an essential phase of any innovation, which includes a mental preparation of the organization or individual from get-to-know the innovation to a decision to implement it (Hsu & Lin, 2015). The innovation process is inadequate if the creation or the final product is restricted just to the innovation initiator but is not embraced by others as well (Mannan & Haleem, 2017). Hence, this research aims to develop, validate and evaluate a new model of determinants that influence the MDM adoption by Malaysia local government organizations.

1.4 Problem Statement

Despite the crucial benefits of the MDM, the adoption rate by organizations has remained at moderate level. In Malaysian public sector, although earlier MDM initiatives have been successfully developed, the adoption rate by the government organizations, particularly local government in providing their master data to the MDM, is growing very slowly. One factor that leads to slow adoption rate of MDM in Malaysian public sector is the absence of guidelines and strategy on the MDM adoption. In addition, there have been limited studies on the MDM adoption in prior

research. The slowness of MDM adoption affects the public service delivery to the citizens, where information and services from different government organizations are not seamless to the citizens, due to the lack of data sharing and data integration among public sector organizations. Hence, it is vital to identify the determinants that influence the MDM adoption in local Malaysia government context.

This research aims to develop, validate and evaluate a new model of the determinants that influence the MDM adoption by Malaysia local government organizations. A rationale to the research motivation was based on the MDM adoption problem of Malaysia local government and knowledge gap analyses of the extant research as described in Section 2.5, page 77. The gap analyses advocate the development of a new MDM adoption model in three justifications: 1) MDM adoption is an underexplored topic in MDM literature, 2) there is a lack of literature on IT adoption exploring local government context in developing countries, and 3) there is lack of TOE research investigating inter-organizational adoption (e.g. MDM) and examining internal relationship between the variables within technological, organizational or environmental dimension. With the development, validation and evaluation of the proposed MDM adoption model in Malaysia local government, the research attempts to address the MDM adoption problem and the knowledge gaps.

1.5 Research Questions

To achieve the research aim, three research questions were formulated as follows:

- (a) RQ1: What are the potential determinants that influence the MDM adoption in Malaysia local government?
- (b) RQ2: What model can be used to explain determinants that influence the MDM adoption in Malaysia local government?
- (c) RQ3: How to evaluate the developed MDM adoption model in Malaysia local government?

1.6 Research Objectives

To answer the formulated research questions, four research objectives were constructed. Those research objectives were defined in order to achieve the overall aim of this research, which is to develop, validate and evaluate a new model of determinants that influence the MDM adoption by Malaysia local government organizations. Table 1.3 associates each research question and its research objectives.

Table 1.3 Research questions and research objectives

Research Questions	Research Objectives
RQ1: What are the potential determinants that influence the MDM adoption by Malaysia local government?	RO1: To identify the potential determinants that influence the MDM adoption by Malaysia local government
RQ2: What model can be used to explain determinants that influence the MDM adoption by Malaysia local government?	RO2: To develop a new MDM adoption model in Malaysia local government
	RO3: To validate the developed MDM adoption model in Malaysia local government through a survey with local government organizations
RQ3: How to evaluate the developed MDM adoption model in Malaysia local government?	RO4: To evaluate the developed MDM adoption model in Malaysia local government by developing a set of guidelines and strategy for MDM adoption in Malaysia local government

1.7 Significance of the Research

The significance of this research is in three-fold: theoretical, contextual, and practical implication. First, the development of a new MDM adoption model of determinants that influence MDM adoption by Malaysia local government has contributed to the new theoretical findings in the field of MDM and IT adoption. This is done by incorporating the theory of TOE framework, Diffusion of Innovations, Fit-Viability Model, and related previous studies to examine the influential determinants of MDM adoption by Malaysia local government. These findings imply that six

determinants of technological (complexity, quality of master data), organizational (data governance, top management support, technological competence), and organizational (citizen demand) could hinder the MDM adoption by Malaysia local government.

As the TOE framework only defines the causal relationship between the constructs under each TOE dimension and IT adoption. This research extends this relationship by examining the internal relationships within the organizational dimension. This research revealed that top management support has influences on technological competence of MDM in Malaysia local government organizations, and this is consistent with the theory of Fit-Viability Model. This relationship appears to be a new addition to the knowledge by enriching the application of the TOE framework. Moreover, the research also contributes to the knowledge by introducing population density of local government as a moderator to the relationship between demand and MDM adoption by local government. Also, the quantitative approach using Partial Least Squares-Structural Equation Modelling (PLS-SEM) for the model validation has contributed to the MDM research area since most of MDM studies use qualitative approaches such as case studies and interviews (Silvola *et al.*, 2011; Spruit & Pietzka, 2014; Vilminko-Heikkinen & Pekkola, 2013). The quantitative approach is a structured way to make a generalization to the whole population (e.g. country or region) by examining the relationship between variables (Creswell, 2014). This research applies a quantitative approach using a survey and collected data from 176 local government departments in Malaysia to examine the relationships of determinants affecting MDM adoption. A total of 224 valid responses were analysed using PLS-SEM for measurement and structural analysis.

Second, the context of this research is Malaysia local government. Although there has been continuous interest in studying IT adoption in local government context in extant research, most of the studies were conducted in developed countries such as Australia, United States, United Kingdom, and Netherlands. It is surprising that the literature on IT adoption in developing countries is very limit. Hence, the findings of this research have addressed the knowledge gap by investigating the determinants of MDM adoption by local government in developing country, which is Malaysia.

Important to realize, quality of master data appeared to be a specific determinants that influence MDM adoption by local government in developing country. This is due to the lower quality of data in developing countries as opposed to the developed countries. Similarly, the moderation effect of population density on the relationship between demand and MDM adoption by local government revealed in this research also distinguished the importance of number of citizens or customers served by an organization in the adoption of IT in the context of developing countries. Hence, the results have a potential to be a reference for other research on IT adoption, particularly in the context of developing country.

Third, the result of this research has a valuable practical contribution. The involvement of MDM and local government practitioners in verifying the initial conceptual model, validating the survey instrument and reviewing the proposed guidelines and strategy has made the finding reliable to be used in real-world phenomena. In addition, to evaluate the developed MDM adoption model in Malaysia local government, this research proposed a set of guidelines and strategy of MDM adoption for the Malaysian public sector (see Appendix N). The proposed guidelines and strategy of MDM adoption will assist the MDM implementation in the Malaysian Public Sector. This is due to the intention of developing more MDM initiatives in the Malaysian public sector has been established in Eleventh Malaysia Plan, 2016-2020 published by The Economic Planning Unit (2016) and the Malaysian Public Sector ICT Strategic Plan 2016-2020 developed by MAMPU (2016b). The findings of this research would be beneficial for the MDM initiators, such as MAMPU, the Ministry of Urban Wellbeing, Housing and Local Government, the Ministry of Rural and Regional Development, and state government. MDM initiators could understand the key constructs that must be considered for MDM adoption so that the implementation of this technology can be widely accepted by local government and other organizations in the future.

1.8 Research Scope

The scope of this research is limited to the five main perspectives: IT adoption stage, IT adoption study, level of analysis, MDM cluster, and respondents. Table 1.4 shows the perspectives, perspective' types and scope applied in this research.

Table 1.4 Scope of the research

Perspective	Type	Scope of this research
IT adoption stage	<ul style="list-style-type: none"> i. Pre-adoption ii. Post-adoption 	Pre-adoption
IT adoption study	<ul style="list-style-type: none"> i. Relational ii. Descriptive iii. Comparative 	Relational
Level of analysis	<ul style="list-style-type: none"> i. Individual ii. Organization 	Organization (department unit of Malaysia local government organizations)
MDM cluster	<ul style="list-style-type: none"> i. Business ii. Education iii. Health iv. Others 	Business
Respondents	Department units of Malaysia local government organizations	<ul style="list-style-type: none"> i. Information Management Department ii. Town Planning Department iii. Business Licensing and Petty Traders Department

The MDM adoption as a dependant variable in this research refers to the intention of Malaysia local government to participate in sharing their master data as data sources to the MDM initiatives. Generally, IT adoption stages can be categorised into two stages of pre-adoption and post-adoption (Lin, 2014). Pre-adoption refers to the initial decision of the organizations to adopt IT innovation. On the other hand, post-adoption refers to the willingness of the organization to continue using the IT

innovation after the implementation stage (Kamal, 2006). This research focuses on the pre-adoption stage of MDM by Malaysia local government, particularly in business domain (i.e. business registration and licensing MDM initiatives).

The nature of this research is a relational study of IT adoption. According to Hanafizadeh, Keating and Khedmatgozar (2014), studies on IT adoption are typically classified into three categories, namely relational, descriptive, and comparative studies. Relational studies aim to investigate causal relationship of variables that influence IT innovation adoption. Descriptive studies identify the characteristic and opinion of IT adopters, adoption challenges, and characteristics of adoption. Whereas comparative studies analyse IT adoption by focusing on the evaluation of major variables, which comprises three sets of studies: population, distribution channel, and methods. This research applied relational approach to investigate the relationship between the independent variables; technological, organizational, and environmental determinants, and the dependant variable; MDM adoption by Malaysia local government.

This research investigates the determinants that influence the MDM adoption by Malaysia local government at the organizational level. IT adoption research mostly categorised into three main adoption levels, namely organizational, individual, and team level (Salahshour, Mehrbakhsh, & Dahlan, 2017). Organization term in this research refers to a department unit as an entity that consists a group of people to achieve the same mission, vision, strategies, and goals (Miles, 2012). The level of analysis in this research includes the departments of Malaysia local government organizations.

Based on the Malaysian Government Online Services Gateway model (Figure 1.3, page 6); MDM is classified into several clusters, such as business, education, and health. This research only focuses on MDM on the business cluster, in particular, the BLESS initiative. Business cluster is among the most important domains in the Malaysian public sector, which contributes to the 'Doing Business' assessment that includes the aspects of business regulation and their implications for firm establishment and operations (World Bank, 2018). Hence, the research only involved

department of Information Management, City Planning and Business Licensing and Petty Traders from 155 Malaysia local government bodies. The selection of these departments as potential respondents is based on the master data entity managed by these departments. These departments are responsible for managing master data regarding business registration and licensing. Sampling frame shows that there is a total of 465 departments of Information Management Department, Town Planning Department, and Business Licensing and Petty Traders Department from 155 Malaysia local government (Johor State Government 2017, KPKT Selected Statistics 2015).

1.9 Structure of the Thesis

This thesis is structured into seven chapters. Chapter 1 gives an overview of the research. It introduces the research background, which briefly introducing the MDM, the Malaysia local government, and MDM adoption scenario by Malaysia local government organizations. It then provides the problem background and problem statement of the research, research questions, and research objectives. And finally outlines the significance of the research and the research scope.

Chapter 2 review the literature and highlights the knowledge gaps in extant research to justify the novelty of this research. The chapter starts with a discussion of the key concepts by explaining the key terms. Subsequently, the chapter reviews related theories of IT adoption at the organizational level. Then, the chapter describes two systematic literature review (SLR) that have been conducted to identify related works within MDM research area and IT adoption in local government context. The chapter analyses a knowledge gap of previous studies to justify the rationale of the current research and proposes a conceptual model for a new MDM adoption model for Malaysia local government. At the end of the chapter, an initial conceptual model is proposed by discussing the theoretical underpinning and matrix analysis between two SLR.

Chapter 3 discusses the research methodology followed for the overall research process to fulfil the research objectives and obtain the expected outcomes. It begins

with a discussion of research philosophy, research roadmap design, and research stages. Chapter 4 explains the process of the conceptual model development. It discusses the expert verifications on the initial conceptual model, research hypotheses, and operational definition.

Chapter 5 presents the empirical data analysis of the research. First, initial preparation is described, including response rate analysis, data cleaning, non-response bias test, common method bias test, and normality test. Second, descriptive analysis of the demographics is presented. Third, the measurement model analysis is discussed, including internal consistency reliability, convergent validity, and discriminant validity. Fourth, the structural model analysis is discussed, including the collinearity, path coefficient, coefficient of determination, effect size, and blindfolding and predictive relevance. Fifth, since this research involves assessing the moderating effect of population on the relationship between citizen demand and MDM adoption, a moderation analysis is also presented. At the end of the chapter, the summary of hypotheses testing is presented.

Chapter 6 presents the discussion of empirical findings of Chapter 5 and model evaluation process. The discussion of determinants of MDM adoption by Malaysia local government is discussed with regards to the technological, organizational, and environmental dimensions. Moreover, moderating effect of population on the relationship between citizen demand and MDM adoption is also elaborated. In evaluating the proposed MDM adoption model in Malaysia local government, the research suggests a set of guidelines and strategy of MDM adoption to the Malaysian public sector. The guidelines and strategy development and validation are discussed in Chapter 6. Finally, Chapter 7 concludes the thesis. It summarizes the findings according to the research objectives, and then it describes the research implications, research limitations followed by recommendations for future research.

RE: Permohonan penyemakan maklumat pelaksanaan e-PBT bagi kajian penyelidikan

Mohamad Zubir bin Sidi <zubir.sidi@kpkt.gov.my>

Mon 8/28/2017 11:48 AM

To: FAIZURA HANEEM MOHAMED ALI <hmafazura2@live.utm.my>;

Cc: MOHD NAZRI BIN KAMA <mdnazri@utm.my>; fhaneem@gmail.com <fhaneem@gmail.com>;

Assalamualaikum,

Puan,

Dengan segala hormatnya saya merujuk kepada emel puan di bawah.

2. Daripada senarai yang puan berikan, setelah di tolak MP Kuantan, hanya 60 PBT yang masih menggunakan sistem ePBT. Manakala tiada perancangan peluasan sistem ePBT ke PBT lain kerana PBT lain telah menggunakan sistem yang mereka bangunkan sendiri.

Sekian, terima kasih.

Subject: Permohonan penyemakan maklumat pelaksanaan e-PBT bagi kajian penyelidikan

Assalamualaikum En. Zubir,

Dengan segala hormatnya saya merujuk kepada perbualan telefon kita sebentar tadi.

Untuk makluman tuan, saya Faizura Haneem merupakan Pegawai Teknologi Maklumat (PTM) yang sedang menyambung pengajian Doktor Falsafah di Universiti Teknologi Malaysia, Kuala Lumpur dalam bidang Sistem Maklumat. Latar belakang penyelidikan saya adalah berkenaan adaptasi sistem maklumat oleh Pihak Berkuasa Tempatan. Bagi membantu kajian penyelidikan saya, amatlah diharapkan pihak Jabatan Kerajaan Tempatan dapat membantu dalam perkara berikut di bawah.

Berdasarkan Buku “Memperkasa Penyampaian Perkhidmatan PBT Menerusi Penggunaan ICT” yang diterbitkan oleh MAMPU pada tahun 2013, m/s 16 dan m/s 23 (rujuk lampiran), ePBT telah melalui beberapa fasa pelaksanaan. Sebahagian statistik penggunaan ada dinyatakan di dalam buku tersebut. Bagi membantu kajian penyelidikan saya, amatlah diharapkan pihak tuan dapat menyemak ketepatan dan menyalurkan maklumat tambahan yang diperlukan dalam Jadual seperti di dalam Lampiran.

Kerjasama pihak tuan amat saya hargai dan saya dahului dengan ucapan terima kasih.

Faizura Haneem,
Universiti Teknologi Malaysia,

Initial Conceptual Model Verification Questionnaire

(Please refer to the next page)

AN ADOPTION MODEL OF MASTER DATA MANAGEMENT FOR LOCAL AUTHORITIES IN MALAYSIA

Introduction:

As part of my doctoral study, you are kindly invited to validate the proposed determinants of Master Data Management (MDM) adoption by local government organizations in Malaysia. MDM enables an establishment of central repository of master data which involve the activities of data sharing, consolidation, and integration among different applications from various organizations. The examples of MDM initiatives in Malaysia are: Business Licensing Electronic Support System (BLESS), and e-Pihak Berkuasa Tempatan (ePBT).

Objectives:

From the literature review conducted, the following model is the initial conceptual model of determinants affecting Master Data Management adoption by Malaysia local government. The determinants are categorized into three main dimensions which are technological, organizational, and environmental. This questionnaire will ask you opinion:

1. To **rate the relevancy of each construct in the model** by rating from 1-5.
2. To give a feedback on **the initial conceptual model of determinants affecting Master Data Management adoption by Malaysia local government**

The success of this survey greatly depends on your participation. Your cooperation is highly appreciated as it is beneficial to both academia and industry.

Thank You.

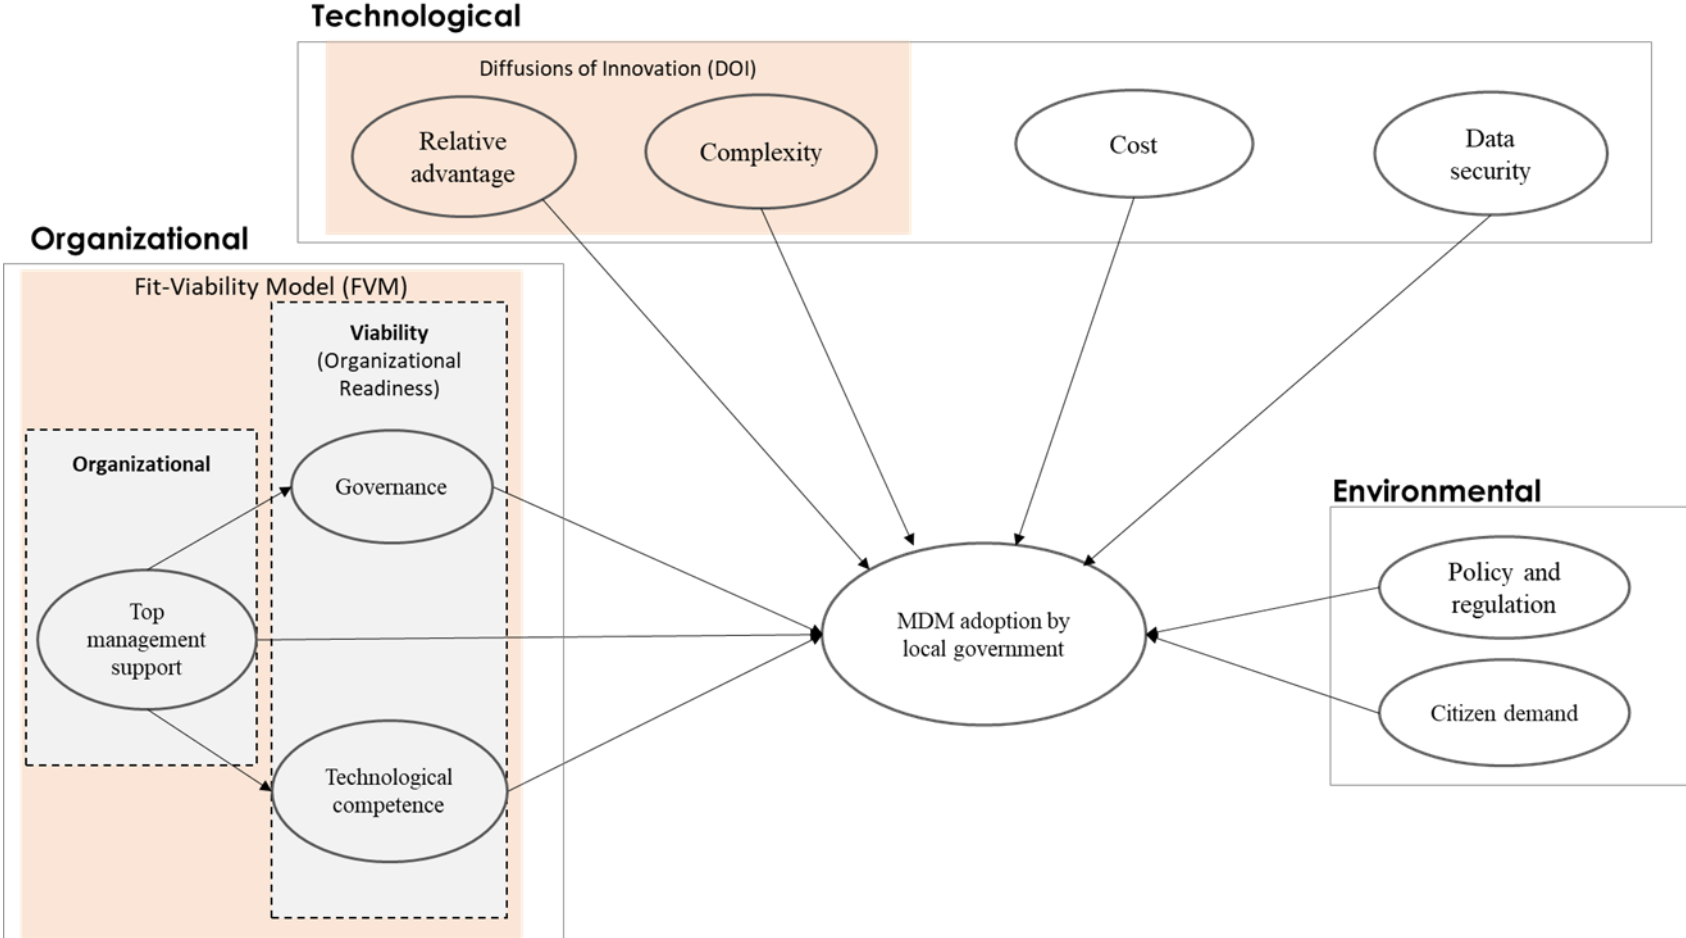

Faizura Haneem binti Mohamed Ali, PAN 153002

Supervisor: Associates. Prof. Dr. Mohd Nazri bin Kama
Co-Supervisor: Dr. Rosmah binti Ali

RESEARCH DEFINITION

Term	Definition	References
Master Data Management (MDM)	A management of shared master data at central level to reduce redundancy and ensure better data quality through a set of processes, governance and technology. It aims to serve data as a 'single reference of truth' to the consumers by consolidating and integrating the master data from multiple data sources into a central repository.	(Cervo and Allen 2011; DAMA 2009; Dreibelbis <i>et al.</i> , 2008)
MDM adoption by local government	The intention of local government organizations in Malaysia to participate in sharing their master data to the MDM innovations such as BLESS and ePBT application	(Rogers, 1995)
Technological Dimension	The characteristics of the MDM which includes the benefits, equipment complexity, data security, and cost to adopt it.	(Tornatzky & Fleischer 1990; Wisdom, Chor, Hoagwood, & Horwitz, 2014)
Organizational Dimension	The measures about the organization which include governance, top management support, technology competency, and sufficient resources.	(Tornatzky & Fleischer, 1990; Wisdom <i>et al.</i> , 2014)
Environmental Dimension	The condition of fields in organization conducts its business which include government policies and citizen demand.	(Tornatzky & Fleischer, 1990; Wisdom <i>et al.</i> , 2014)

Proposed/Initial Conceptual Model - Determinants of Master Data Management Adoption by Malaysia local government

270

No.	Items/Questions	Relevancy				
		1	2	3	4	5
M-1	Do you agree that Relative Advantage is positively influence Malaysia local government to adopt MDM innovations?					
M-2	Do you agree that Complexity is negatively influence Malaysia local government to adopt MDM innovations?					
M-3	Do you agree that Cost is positively influence Malaysia local government to adopt MDM innovations?					
M-4	Do you agree that Data Security is positively influence Malaysia local government to adopt MDM innovations?					
M-5	Do you agree that Governance is positively influence Malaysia local government to adopt MDM innovations?					
M-6	Do you agree that Top Management Support is positively influence Malaysia local government to adopt MDM innovations?					
M-7	Do you agree that Top Management Support is positively influence Data Governance and Technological Competence in Malaysia local government to adopt MDM innovations?					
M-8	Do you agree that Technological Competency is positively influence Malaysia local government to adopt MDM innovations?					
M-9	Do you agree that Policy and Regulation that support MDM innovation is positively influence Malaysia local government to adopt MDM innovations?					
M-10	Do you agree that Citizen Demand on MDM innovation is positively influence Malaysia local government to adopt MDM innovations?					
Comments/Suggestions to improve the conceptual model based on Malaysia local government context:

AN ADOPTION MODEL OF MASTER DATA MANAGEMENT FOR LOCAL AUTHORITIES IN MALAYSIA

Introduction:

As part of my doctoral study, you are kindly invited to validate the proposed determinants of Master Data Management (MDM) adoption by local government organizations in Malaysia. MDM enables an establishment of central repository of master data which involve the activities of data sharing, consolidation, and integration among different applications from various organizations. The examples of MDM initiatives in Malaysia are: Business Licensing Electronic Support System (BLESS), and e-Pihak Berkuasa Tempatan (ePBT).

Objectives:

From the literature review conducted, the following items are the influencing determinants of MDM adoption by the local government. The determinants are categorized into three main dimensions which are **technological, organizational, and environmental**. This survey will ask you opinion:

1. To **rate the relevancy of each measurement item** by rating from 1-5.
2. To give a **suggestion** for each construct in terms of the **measures, words that are difficult to comprehend, duplicate meanings, vocabulary, and long sentences**. The actual survey will involve respondents from Local Government organizations in Malaysia (senior executives and above).

The success of this survey greatly depends on your participation. Your cooperation is highly appreciated as it is beneficial to both academia and industry.

Thank You.

RESEARCH DEFINITION

Term	Definition	References
Master Data Management (MDM)	A management of shared master data at central level to reduce redundancy and ensure better data quality through a set of processes, governance and technology. It aims to serve data as a ‘single reference of truth’ to the consumers by consolidating and integrating the master data from multiple data sources into a central repository.	(Cervo and Allen 2011; DAMA 2009; Dreibelbis <i>et al.</i> , 2008)
MDM adoption by local government	The willingness of Malaysia local government to participate in sharing their master data to the MDM innovations	(Rogers, 1995)
Technological Dimension	The characteristic of the MDM innovation which relevant to the organization	(Tornatzky and Fleischer 1990; Wisdom, Chor, Hoagwood, & Horwitz, 2014)
Organizational Dimension	The resources characteristic and linking structure of the personnel of the organization which related to the MDM innovation	(Tornatzky & Fleischer, 1990; Wisdom <i>et al.</i> , 2014)
Environmental Dimension	The arena in which the organization conducts its business	(Tornatzky & Fleischer, 1990; Wisdom <i>et al.</i> , 2014)

Please read each item and give any comment for its relevance for the survey instrument.

SECTION A: RESPONDENT PROFILE

No.	Items/Questions	Comment(s)
A1	Name of Local Government organization/ local authority:	
A2	State:	
A3	Number of citizen population served by the organization (leave if you are not sure): persons	
A4	Designation Category <input type="radio"/> Top Management <input type="radio"/> Executive and above <input type="radio"/> Non-Officer <input type="radio"/> Others, please specify	
A5	Department:	
A6	Working Experience in Local Governments <input type="radio"/> None/Fresh Graduate <input type="radio"/> 1-5 Years <input type="radio"/> 6-10 Years <input type="radio"/> 11 Years and Above	
A7	Working Experience in data management <input type="radio"/> None/Fresh Graduate <input type="radio"/> 1-5 Years <input type="radio"/> 6-10 Years <input type="radio"/> 11 Years and Above	
A8	Select master data that you are currently managing/have once managed: <input type="radio"/> Customer's profile <input type="radio"/> Agency's profile <input type="radio"/> Assets profile <input type="radio"/> Geographic data (GIS) <input type="radio"/> Agency's products and services. Please specify : <input type="radio"/> Others. Please specify:	
A9	My organization has adopted one of Master Data Management innovation in Malaysia (i.e. BLESS) - Yes - No	

Please read each item and rate it for its relevance in representing the factor. Please give comments and tick (✓) at the number from **1 to 5** as indication of the level of your argument with the statement. The agreement scale of **Relevancy** are:

SECTION B: TECHNOLOGICAL DIMENSION

RA		Relative Advantage				
Definition		The degree of the MDM innovation could improve service delivery, provide better communication, reduce data management cost, providing timely decision-making, and reduce data quality issue.				
Adapted from		(Premkumar & Roberts, 1999) (Vilminko-Heikkinen & Pekkola 2013)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
RA1	Implementing MDM will increase the profitability of my organization through service delivery improvement					
RA2	Adoption of MDM will provide timely information for decision-making					
RA3	Data duplication in my organization will be reduced as my organization can refer to the MDM for other related master data without having to create some new ones					
RA4	The MDM will allow my organization to cut costs in our data management operations since common master data are managed by the central repository					
RA5	The MDM will improve the data quality in my organization through data sharing with other public organizations					
Comments/Suggestions:						

Sub Section CX		Complexity				
Definition		The degree of organization difficulty to understand and implement the MDM innovation				
Adapted from		(Premkumar & Roberts, 1999) (Loshin, 2009)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
CX1	Identifying master data of my organization that can be shared with MDM is difficult					

CX2	Master data of my organization need to undergo a complex data cleansing process before being shared with MDM					
CX3	Integrating MDM innovation in our current work practices will be very difficult					
CX4	The skills required to use MDM are too complex for our employees.					
Comments/Suggestions:						

Sub Section DQ		Quality of Master Data				
Definition		The degree of completeness, uniqueness, timeliness, validity, accuracy, and consistency of master data at the local government organization				
Adapted from		(DAMA UK Working Group, 2013)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
DQ-1	Master data in my organization are complete					
DQ-2	Master data in my organization are not duplicate					
DQ-3	Master data in my organization are up-to-date					
DQ-4	Master data in my organization are valid					
DQ-5	Master data in my organization are accurate					
DQ-6	Master data in my organization are consistent					
Comments/Suggestions:						

Sub Section DS		Data Security				
Definition		The degree to which MDM innovation could preserve data confidentiality, integrity and availability				
Adapted from		(Soliman & Janz, 2004) (Hristidis <i>et al.</i> , 2010) (Smallwood, 2014)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
DS1	Data exchange between my organization and central repository of the MDM requires a secured communication medium					

DS2	In the MDM repository, data is safeguarded from unauthorized changes					
DS3	In the MDM repository, sensitive master data is protected from those who should not have access to it					
DS4	MDM requires disaster management to protect data in the MDM repository from any disaster					
DS5	The data exchange transactions between my organization and MDM need to have digital signature verification					
Comments/Suggestions:						

SECTION C: ORGANIZATIONAL DIMENSION

Sub Section DG		Data Governance				
Definition		The strategy of organization in terms of defining operation procedures, roles and responsibilities in steering the MDM innovation				
Adapted from		(Hung <i>et al.</i> , 2014) (Smallwood 2014)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
DG1	The stakeholder's organization, data owner, and data stewardship for the MDM implementation will be identified					
DG2	The achievement of MDM comes from the ongoing responsibility taken					
DG3	The MDM implementation will identify the accountability of decision making					
DG4	My organization will follow the systematic procedure for dealing with changes caused by the implementation of MDM					
DG5	My organization will certainly define the business cases for every initiative or application of the MDM					
DG6	My organization will clearly define a measure to evaluate the impact of adopting MDM					
Comments/Suggestions:						

Sub Section TS		Top Management Support				
Definition		The degree of top management to create a supportive environment and providing adequate financial and human resources for the adoption of MDM innovation				
Adapted from		(Premkumar & Roberts, 1999)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
TS1	Top management in my organization is highly interested in using MDM					
TS2	Top management in my organization is aware of the benefits of MDM for the future success of the organization					
TS3	Top management in my organization has allocated adequate financial and human resources for the development and operation of MDM					
TS4	Top management has the vision to project in my organization as a leader in the promotion of MDM					
Comments/Suggestions:						

Sub Section TC		Technological Competency				
Definition		The degree of organization capability which includes IT infrastructure and human resources availability in terms of expertise, skills and sufficient number of personnel to adopt and implement the MDM innovation.				
Adapted from		(Lin, 2006) (Wang & Wang, 2016)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
TC1	The ICT infrastructure for supporting applications integration with MDM is available in my organization					
TC2	My organization contains a high level of MDM innovation knowledge					
TC3	My organization contains a high level of MDM innovation acceptance					
TC4	My organization is dedicated to ensuring the employees' expertise in MDM technology					
TC5	The IT expertise of the personnel in my organization is good					
TC6	My organization will provide sufficient business personnel to implement MDM					
Comments/Suggestions:						

SECTION D: ENVIRONMENTAL DIMENSION

Sub Section GP		Government Policy				
Definition		The existence of government fundamental policies or standard for the MDM adoption or implementation by the organization				
Adapted from		(M. Allen & Delton Cervo, 2015) (Lian <i>et al.</i> , 2014) (Kuan & Chau, 2001)(Awa & Ojiabo, 2016)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
GP1	Government has established a policy to support data sharing among government organizations					
GP2	Government has established a data quality management policy					
GP3	Current laws and regulations are insufficient to protect my organization's interest					
GP4	MDM innovation has been established as one of the aims in the 11th Malaysia Plan					
GP5	The government needs to establish data security policies in the operation of MDM					
Comments/Suggestions:						

Sub Section CD		Citizen Demand				
Definition		The extant of citizen demand towards the MDM innovation				
Adapted from		(Wang & Feeney, 2016)				
No.	Items/Questions	Relevancy				
		1	2	3	4	5
CD1	Citizens demand an integrated service among local government departments from my organization					
CD2	Citizens can easily use the online services that provide services across multiple local governments units					
CD3	Silo management of services across local government authorities will lower citizen trust in local government					
CD4	Citizens have very high demand for integrated, timely, and quick information through online web and mobile					
Comments/Suggestions:						

SECTION E: ADOPTION OF MASTER DATA MANAGEMENT INNOVATION

Sub Section MA	MDM Adoption					
Definition	The willingness of Malaysia local government to participate in sharing their master data to the MDM innovations					
Adapted from	Awa, H. O., Awa, H. O., Ojiabo, O. U., & Ojiabo, O. U. (2016)					
No.	Items/Questions	Relevancy				
		1	2	3	4	5
MA1	My organization will adopt MDM to improve service delivery					
MA2	My organization will adopt MDM to improve data quality management					
MA3	My organization will adopt MDM to improve operational efficiencies and reduce operational costs					
MA4	My organization will adopt MDM to improve inter-organizational data exchange					
MA5	My organization will adopt MDM to reduce data duplication among government organizations					
MA6	My organization will adopt MDM to improve operation integration across agencies					
Comments/Suggestions:

TRANSLATION_CONTENT VALIDITY OF RESEARCH INSTRUMENT.docx

Assalamualaikum Dr. Roslina Ibrahim,

My name is Faizura Haneem binti Mohamed Ali, a PhD candidate from AIS, UTM Kuala Lumpur under supervision of Prof Madya Dr. Nazri Kama. I would like to invite you for the expert review on the translation of my research instrument regarding adoption of Master Data Management by Local Authorities in Malaysia. The selection criteria is based on your expertise in Information Systems instrument development.

Here I attached the translation of the research instrument (draft) for your kind review. I'm looking forward for your feedback and your kind cooperation is highly appreciated.

Thank you.

Faizura Haneem,
PhD. candidate,
AIS, UTM Kuala Lumpur

Survey Form - Malay Version

(Please refer to the next page)

**SOAL SELIDIK BERKENAAN 'FAKTOR-FAKTOR YANG MEMPENGARUHI
PENERIMAGUNAAN REPOSITORI RUJUKAN DATA BERPUSAT (RRDP) OLEH PIHAK
BERKUASA TEMPATAN DI MALAYSIA**

Y.Bhg. Prof./Prof. Madya/Dr./Tuan/Puan,

Saya merupakan seorang pelajar PhD. di Universiti Teknologi Malaysia, Kampus Kuala Lumpur (UTMKL) dan sedang menjalankan kajian mengenai faktor-faktor yang mempengaruhi penerimgunaan Repositori Rujukan Data Berpusat (RRDP) oleh Pihak Berkuasa Tempatan di Malaysia.

Repositori Rujukan Data Berpusat (RRDP) merupakan **repositori pusat** yang diwujudkan di peringkat pusat melalui pengumpulan **data-data utama** seperti profil pelanggan, aset, GIS, produk dan perkhidmatan daripada agensi-agensi kerajaan. RRDP boleh dirujuk oleh agensi-agensi kerajaan bagi mendapatkan data-data utama yang sah dengan cepat dan tepat. RRDP **mengurangkan duplikasi data dan memastikan pengurusan data yang lebih berkualiti** menerusi pengurusan proses yang sistematik, tadbir urus dan aplikasi teknologi.

Kaji selidik ini hanya akan mengambil masa kira-kira 10-15 minit dan ia hanya untuk tujuan akademik sahaja. Saya amat menghargai jika anda dapat menjawab kaji selidik ini sebelum 30 November 2017. Saya ingin mengucapkan terima kasih terlebih dahulu untuk penyertaan anda dalam kaji selidik ini dan kerjasama anda sangat dihargai.

Terima kasih.

Untuk maklumat lanjut, anda boleh menghubungi:

Faizura Haneem binti Mohamed Ali (PAN 153002)
Advanced Informatics School (AIS)
Universiti Teknologi Malaysia, Kampus Kuala Lumpur (UTMKL)
E-mail: fhaneem@gmail.com atau hmfaizura2@live.utm.my
Telefon: 019-2718144

Penyelia: Prof. Madya Dr. Mohd Nazri Kama, Timbalan Dekan
Advanced Informatics School (AIS)
Universiti Teknologi Malaysia, Kampus Kuala Lumpur (UTMKL)

SEKSYEN A: PROFIL RESPONDEN

<p>Nama Agensi Pihak Berkuasa Tempatan:</p> <p>.....</p>	<p>Bahagian/ Jabatan:</p> <p>.....</p>
<p>Kumpulan Jawatan:</p> <ul style="list-style-type: none"> <input type="radio"/> Pengurusan Tertinggi <input type="radio"/> Eksekutif <input type="radio"/> Kumpulan Sokongan <input type="radio"/> Lain-lain, sila nyatakan 	<p>Pengalaman bekerja di Pihak Berkuasa Tempatan:</p> <ul style="list-style-type: none"> <input type="radio"/> 11 tahun dan ke atas <input type="radio"/> 6-10 tahun <input type="radio"/> 1-5 tahun <input type="radio"/> Kurang 1 tahun
<p>Pengalaman dalam pengurusan maklumat/data:</p> <ul style="list-style-type: none"> <input type="radio"/> 11 tahun dan ke atas <input type="radio"/> 6-10 tahun <input type="radio"/> 1-5 tahun <input type="radio"/> Kurang 1 tahun 	<p>Pilih data utama yang sedang diuruskan /pernah diurus oleh anda:</p> <ul style="list-style-type: none"> <input type="radio"/> Profil pelanggan <input type="radio"/> Profil Aset <input type="radio"/> Data Geografi (GIS) <input type="radio"/> Produk dan perkhidmatan agensi <input type="radio"/> Lain-lain. Sila nyatakan:
<p>Agensi saya telah terlibat dalam perkongsian data dan penggunaan RRDP dalam domain pelesenan perniagaan seperti Business Licensing Electronic Support System (BLESS) – Inisiatif di bawah Unit Penyelarasan Pelaksanaan (ICU).</p> <ul style="list-style-type: none"> - Ya - Tidak - Tidak Pasti 	
<p>Populasi rakyat (anggaran) yang diuruskan oleh agensi:</p> <p>..... orang</p>	

SEKSYEN B: FAKTOR TEKNOLOGI

1-Amat Tidak Setuju 2-Tidak Setuju 3-Neutral 4-Setuju 5-Amat Setuju

No.	FAEDAH RRDP	1	2	3	4	5
RA-1	RRDP akan menguntungkan agensi saya dengan peningkatan penyampaian agensi saya					
RA-2	RRDP akan membantu pembuatan keputusan agensi saya melalui data-data utama yang sahih dan terkini					
RA-3	Duplikasi data agensi saya akan berkurang kerana agensi saya boleh merujuk RRDP tanpa perlu mewujudkan data-data utama yang baru di agensi					
RA-4	RRDP akan mengurangkan kos operasi pengurusan data di agensi saya kerana agensi saya tidak perlu mengurus data-data utama yang boleh didapati daripada RRDP					
RA-5	RRDP akan meningkatkan kualiti data agensi saya melalui perkongsian data antara agensi saya dan agensi-agensi kerajaan yang lain					

No.	KOMPLEKSITI	1	2	3	4	5
CX-1	Proses mengenalpasti data yang boleh dikongsi oleh agensi saya dengan RRDP adalah sukar					
CX-2	Data-data utama agensi saya perlu melalui proses pembersihan yang rumit sebelum dikongsi dengan RRDP					
CX-3	Pengintegrasian aplikasi-aplikasi agensi saya dengan RRDP sukar dilaksanakan					
CX-4	Kemahiran teknikal yang tinggi diperlukan bagi penyelenggaraan integrasi aplikasi-aplikasi agensi saya dengan RRDP					

No.	KUALITI DATA	1	2	3	4	5
DQ-1	Pada masa ini, data utama agensi saya adalah lengkap					
DQ-2	Pada masa ini, data utama agensi saya adalah tidak bertindan di antara aplikasi-aplikasi di agensi saya					
DQ-3	Pada masa ini, data utama dalam agensi saya adalah terkini					
DQ-4	Pada masa ini, data utama dalam agensi saya adalah sah					
DQ-5	Pada masa ini, data utama dalam agensi saya tepat					
DQ-6	Pada masa ini, data utama dalam agensi saya konsisten					

No.	KESELAMATAN DATA	1	2	3	4	5
DS-1	Perkongsian data di antara agensi saya dan RRDP memerlukan saluran komunikasi yang selamat (https atau encryption)					
DS -2	RRDP perlu melindungi data-data utama daripada perubahan yang tidak dibenarkan					
DS -3	RRDP perlu melindungi data-data utama daripada diakses oleh mereka yang tidak sepatutnya mempunyai akses					
DS-4	Pusat Data RRDP perlu mewujudkan Disaster Recovery Center (DRC) bagi melindungi data-data utama agensi yang ditempatkan di RRDP daripada sebarang bencana					
DS-5	Segala transaksi pertukaran data (data exchange) antara agensi saya dan RRDP perlu menggunakan pengesahan tandatangan digital					

SEKSYEN C: FAKTOR ORGANISASI

No.	TADBIR URUS DATA	1	2	3	4	5
DG -2	Keberjayaan tadbir urus RRDP berpunca daripada tanggungjawab yang berterusan					
DG -3	Tadbir urus RRDP bersama agensi-agensi terlibat perlu mengenalpasti kebertanggungjawaban pengambilan keputusan					
DG -4	Tadbir urus RRDP perlu mewujudkan prosedur yang sistematik untuk menangani perubahan hasil pelaksanaan RRDP					
DG -5	Tadbir urus RRDP perlu mengenalpasti data, aplikasi dan proses kerja yang terlibat di agensi					
DG -6	Tadbir urus RRDP perlu menentukan pengukuran untuk menilai impak/kesan penggunaan RRDP di agensi					

No.	SOKONGAN PENGURUSAN ATASAN	1	2	3	4	5
TS-1	Pengurusan atasan agensi saya akan berminat untuk menggunakan RRDP jika mengetahui faedah RRDP kepada agensi saya					
TS-2	Pengurusan atasan agensi saya menyedari akan faedah RRDP yang akan menyumbang kepada kejayaan agensi					
TS-3	Pengurusan atasan agensi saya akan memperuntukkan sumber-sumber bisnes dan IT yang mencukupi bagi penggunaan RRDP					
TS-4	Pengurusan atasan agensi saya mempunyai visi untuk mensasarkan agensi sebagai peneraju dalam mempromosi penggunaan RRDP					

No.	KOMPETENSI TEKNOLOGI	1	2	3	4	5
TC-1	Infrastruktur ICT untuk menyokong pengintegrasian aplikasi berkaitan RRDP tersedia di agensi saya					
TC-2	Agensi saya mengandungi pengetahuan mengenai RRDP yang tinggi					
TC-3	Tahap penerimaan agensi saya terhadap RRDP adalah tinggi					
TC-4	Agensi saya akan berdedikasi untuk memastikan kemahiran pekerja dalam membangun dan menyelenggara pengintegrasian RRDP dan aplikasi-aplikasi agensi saya					
TC-5	Kepakaran kakitangan teknologi maklumat agensi saya dalam mempelajari pelaksanaan pengintegrasian RRDP dan aplikasi-aplikasi agensi saya adalah tinggi					
TC-6	Agensi saya akan menyediakan kakitangan bisnes yang mencukupi untuk melaksanakan pengintegrasian RRDP dan aplikasi-aplikasi agensi saya					
TC-7	Agensi saya akan menyediakan kakitangan teknologi maklumat yang mencukupi untuk melaksanakan pengintegrasian RRDP dan aplikasi-aplikasi agensi saya					

SEKSYEN D: FAKTOR PERSEKITARAN

No.	POLISI KERAJAAN	1	2	3	4	5
GP-1	Kerajaan perlu menubuhkan polisi bagi menyokong perkongsian data di kalangan agensi pihak berkuasa tempatan					
GP -2	Kerajaan perlu menubuhkan polisi pengurusan kualiti data merentasi agensi sektor awam					
GP -3	Undang-undang dan peraturan semasa perlu dikemaskini bagi melindungi kepentingan agensi dalam penglibatan dengan inisiatif RRDP					

GP -4	Halatuju dorongan data (data-driven) dalam Rancangan Malaysia ke-11 akan menyokong keberjayaan pelaksanaan RRDP					
GP-5	Kerajaan perlu menubuhkan dasar keselamatan maklumat dalam pengoperasian RRDP dalam menggalakkan penglibatan agensi dengan inisiatif RRDP					

No.	PERMINTAAN RAKYAT	1	2	3	4	5
CD-1	Rakyat mempunyai permintaan tinggi bagi perkhidmatan bersepadu di kalangan pihak berkuasa tempatan					
CD-2	Rakyat dapat menggunakan perkhidmatan dalam talian yang menyediakan perkhidmatan daripada pelbagai pihak berkuasa tempatan					
CD-3	Pengurusan perkhidmatan yang tidak merentasi agensi di seluruh pihak berkuasa kerajaan tempatan akan menyebabkan kepercayaan rakyat yang rendah kepada agensi saya					
CD-4	Rakyat mempunyai permintaan tinggi terhadap penyaluran maklumat kepada rakyat dengan cepat dan tepat melalui aplikasi web dan telefon pintar					

SEKSYEN E: PENERIMAGUNAAN REPOSITORI RUJUKAN DATA BERPUSAT (RRDP)

No.	Soalan	1	2	3	4	5
MA-1	Agensi saya akan menerimaguna RRDP untuk meningkatkan penyampaian perkhidmatan kepada rakyat					
MA-3	Agensi saya akan menerimaguna RRDP untuk meningkatkan kecekapan operasi dan mengurangkan kos operasi					
MA-4	Agensi saya akan menerimaguna RRDP untuk menggalakkan perkongsian dan pertukaran data antara agensi					
MA-5	Agensi saya akan menerimaguna RRDP untuk mengurangkan duplikasi data merentasi agensi					
MA-6	Agensi saya akan menerimaguna RRDP untuk meningkatkan pengintegrasian operasi merentasi agensi

20 November 2017

To Whom It May Concern,

Dear Sir/Madam,

PERMISSION TO CONDUCT RESEARCH AND SURVEY

STUDENT NAME : FAIZURA HANEEM BINTI MOHAMED ALI
MATRIC NO. : PAN153002
RESEARCH TITLE : MASTER DATA MANAGEMENT IN PUBLIC SECTOR
(REPOSITORI RUJUKAN DATA BERPUSAT SEKTOR AWAM)

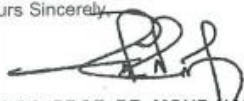

With reference to the above matter,

- I am pleased to inform you that **Faizura Haneem binti Mohamed Ali** is a registered post graduate student of Advanced Informatics School, Universiti Teknologi Malaysia, Kuala Lumpur.
- For your information, she needs your permission to do research and collect data from you for research purposes. This research is important and required among students enrolled in Doctor of Philosophy (Research) program at UTM AIS.
- Should you have any enquiries please do not hesitate to call the undersigned or directly contact our office at 03-2180 5217.

Your cooperation is very much appreciated. Thank you.

"BERKHIDMAT UNTUK NEGARA"

Yours Sincerely,

ASSOC. PROF. DR. MOHD NAZRI BIN KAMA

Appendix N

Master Data Management (MDM) Adoption Guidelines & Strategy for the Malaysian Public Sector

PURPOSE

This document outlines the MDM adoption guidelines for the use of MDM initiators, data steward and data provider organizations that involved in MDM initiative in the Malaysian public sector. These guidelines consist of the action needed to be taken by the MDM initiators during the adoption stage of MDM to encourage the participation of multiple government agencies in the MDM initiatives as data providers as well as the responsibilities of data steward and data provider organizations throughout the implementation. These guidelines should be used in complementary manner with other government related guidelines such as the circular of Open Data Implementation and Big Data Implementation in the Malaysian Public Sector in order to have a more effective MDM implementation and adoption.

BACKGROUND

One of the government initiatives to reduce data duplication, increase data quality, enable broader data integration, and eliminate redundant integration activities is establishing Master Data Management (MDM). MDM involves the activities of identifying, consolidating, and integrating master data from multiple data sources from different organizations into central data repository. With the MDM, master data from multiple government organizations which potentially valuable across government organizations are identified and consolidated in a central repository of. This repository is served as a 'single source of truth' by many applications across organizations.

The MDM has been positioned as the heart of the Malaysian Government Online Services Gateway model (refer Figure 1) to allow horizontal information sharing and integration across multiple organizations. Centralization and integration of master data from various sources happen through data sharing between data provider organizations (e.g. central, state, and local government) and MDM repositories. The centralized master data in MDM are consumed by multiple data consumers' applications (e.g. business, education, and health clusters) through data brokers for the establishment of

government online services. Figure 1 presents the elements of the Malaysian Government Online Services Gateway model.

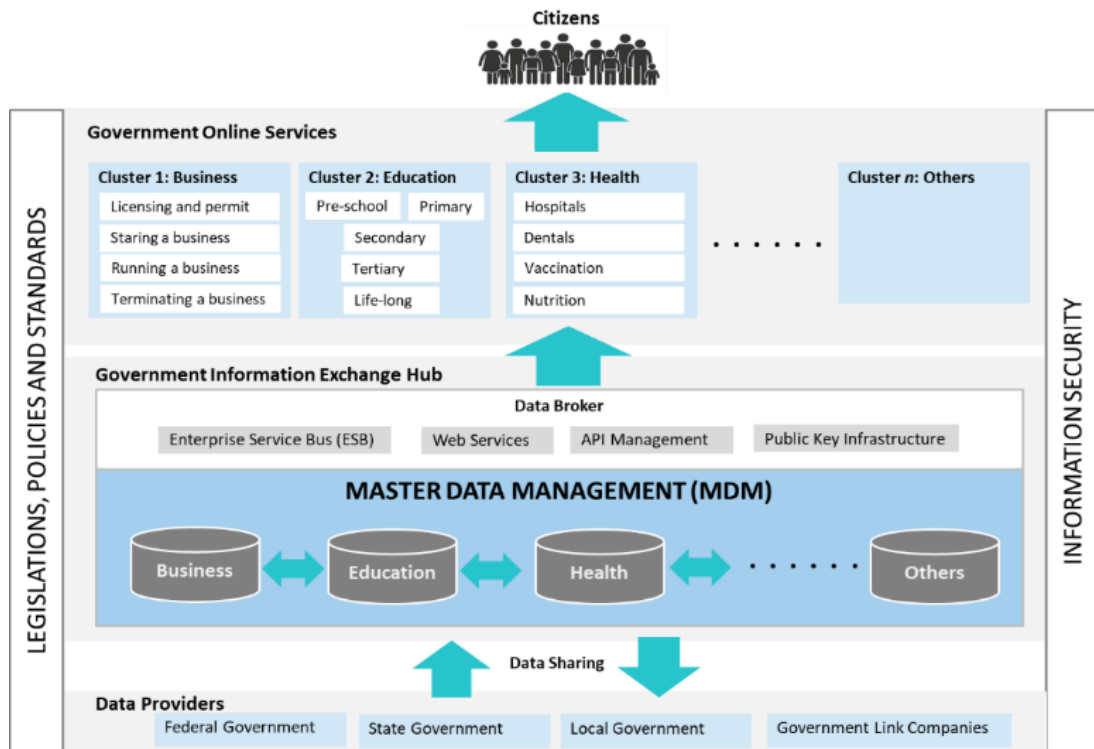

Figure 1: Malaysian Government Online Services Gateway model

Recognizing the importance of implementing MDM in the Malaysian public sector, this document presents the guidelines of MDM adoption to encourage data sharing activities among government organizations.

DEFINITION

‘Master Data Management’ or MDM in short is referring to the management of shared master data at central level to reduce data redundancy and ensure better data quality with a combination of process, governance, and technology.

‘Master Data’ is referring to the critical business data in an organisation, potentially valuable to be shared across several different systems or organisational units and serve as a reference for transactional data.

‘MDM initiator’ is referring to the organization that initiate the MDM initiative and commonly is the regulator body of the MDM program

‘Data steward’ is referring to the data steward or data custodian organization that manage the consolidated master data at the MDM repository at central level

‘Data provider’ is referring to the organization that own the master data and responsible as a data provider to share their master data to the MDM repository.

‘Data source’ is referring to the databases which stores the master data in data provider organizations.

‘MDM repository’ is referring to the central repository which consolidate master data from multiple data source from data provider organizations across public sector.

GUIDELINES

A. Technological Context:

i. Master data identification

Data provider organization should identify the master data of the organization. Master data master is defined as an enterprise-critical data that is consumed by different business processes, across organizational units, and between operational systems and decision support systems. The master data must be clearly differentiated from the transactional data where master data entities are often unchanged and relatively constant such as properties of the material.

ii. Data Cleansing

Data provider organization should perform data cleansing to the identified master data before sharing them with the MDM repository. Data cleansing is used to identify duplicates within the master data when unique identifiers are unavailable. It relies primarily on matching of names, attributes, and other non-unique identifiers.

iii. Data Mapping and Synchronization

After the data cleansing process, the data provider organization and the data steward should perform and agree on the schema mappings between master data sources and MDM repository (also known as meta data).

iv. Data Integration

Data steward should integrate the master data from different data sources in order to provide a unified view of them. The data integration is responsible for detecting

records from different data sources that represent the same instance from the real world. The data integration could be achieved using schema mappings.

v. Data Maintenance & Support

Data steward and data provider organizations should perform continuous data maintenance and support. This is to ensure the synchronization between master data sources and MDM repository is constantly running to ensure that the consolidated master data at the MDM are the latest updates from the sources.

vi. Data Quality

Data provider organization should continuously ensure master data in the organization are complete, not duplicate, up-to-date, valid, accurate, and consistent. Data provider organization should continuously perform Total Data Quality Management (TDQM) in the organization. The measurement of each data quality characteristic is described as follows:

Completeness: The degree of completeness of master data items at the sources. It is measure by comparing the presence of non-blank values against a hundred per cent (100%) complete of the master data items.

Uniqueness: The degree of uniqueness of master data items at the sources. It is measure by analysing the number of things as assessed in the 'real world' compared to the number of entities in the master data set.

Timeliness: The degree of up-to-date records of master data items at the sources.

Validity: The degree of master data at the sources that conform to the syntax (format, type, range) of its definition.

Accuracy: The degree to which master data at the sources correctly describes the real-world object or event being described.

Consistency: The degree of similarity of one of more representatives of master data entities at the sources.

B. Organizational Context

i. Data Governance

MDM initiator is advised to set up a committee at the early stage of MDM implementation before the actual implementation being in place. The roles and responsibility should be specific to ensure the smooth and effective decision-making process. MDM implementation monitoring should be made as a regular agenda in the committee meeting which involve multiple participated parties from different organizations across government agencies. Figure 2 illustrates the committee structure of the MDM data governance and Table 1 presents the responsibilities of each role.

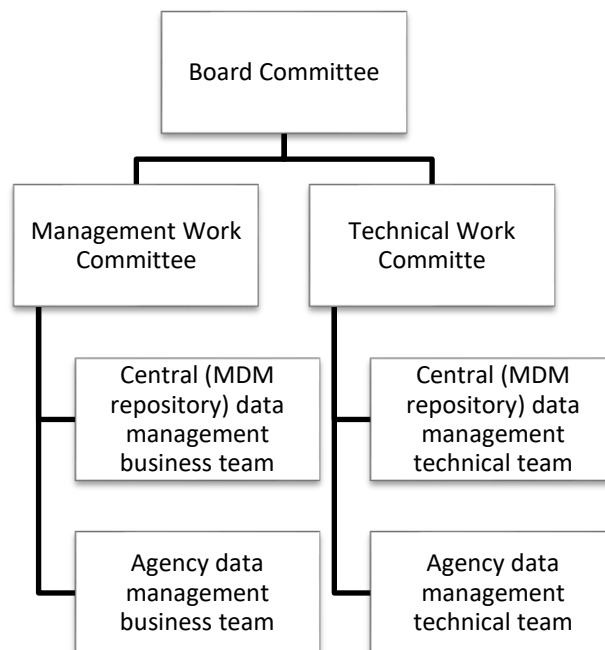

Figure 2: Data governance committee

a. Board Committee

The Committee is responsible for ensuring MDM implementation is made according to the established policies. The Committee is chaired by a senior officer responsible for the MDM initiative. The members comprising representatives of top management from MDM initiator, data steward, and data provider organizations.

b. Management work committee

The Committee is responsible for providing strategic and business-related assistance for the MDM implementation. The Committee is chaired by the related business department manager from the MDM initiator or regulator organization. The members comprising business managers from the data steward, and data provider organizations.

c. Technical work committee

The Committee is responsible for providing technical assistance for the MDM implementation. The Committee is chaired by Information and Communication Technology (ICT) Manager from the MDM initiator or regulatory body organization. The members comprising the ICT managers from the data steward, and data provider organizations.

d. Central (MDM repository) data management business team

Business data management team in data steward organization which responsible in managing the consolidated master data in the MDM repository at central level.

e. Agency data management business team

Business data management team in data provider organizations which responsible in verifying the quality of master data in the organization before sharing with the MDM repository.

f. Central (MDM repository) data management technical team

Technical data management team in data steward organization which responsible in managing the consolidated master data in the MDM repository at central level.

g. Agency data management technical team

Technical data management team in data provider organizations which responsible in preparing the quality of master data in the organization before sharing with the MDM repository.

Table 1: Roles and responsibility of data governance committee structure

Roles	Responsibilities
Board committee	<ul style="list-style-type: none"> i. Establish policy and implementation strategy the MDM implementation aligned with the national aspiration ii. Outline a clear vision and objectives of the MDM implementation iii. Monitor the achievement of the MDM implementation iv. Endorse proposed improvements proposed by the Management work committee in the legal, policy, procedures and regulations
Management work committee	<ul style="list-style-type: none"> i. Monitor the MDM implementation in line with the action plan

	<ul style="list-style-type: none"> ii. Identify measurement of performance and determination standards. iii. Propose improvements (if applicable) in the legal, policy, procedures and regulations iv. Approve proposed improvements proposed by the technical work committee v. Report status of development progress of the MDM implementation to the Board Committee.
Technical work committee	<ul style="list-style-type: none"> i. Provide advice on the data management with regards to the technical issues of the MDM implementation ii. Accept and approve project deliverables iii. Review and make recommendations for improvements iv. Report status of development progress of the MDM implementation to the Management work committee
Central (MDM repository) data management business team	<ul style="list-style-type: none"> i. Provide advice on the data management with regards to the core functions (core business) of the MDM ii. Ensure the data quality process is being implemented in handling the data at the central level iii. Verify the quality of master data in the MDM repository v.
Agency data management business team	<ul style="list-style-type: none"> i. Provide advice on the data management with regards to the core functions (core business) of the agency ii. Work with agency data management technical team to identify the master data in the organization iii. Ensure the data quality process is being implemented in handling the data at the agency level iv. Verify the quality of master data in the agency before sharing with the MDM repository
Central (MDM repository) data management technical team	<ul style="list-style-type: none"> i. Provide advice on the data management with regards technical of the MDM ii. Perform the data quality process at the central level iii. Prepare the quality of consolidated master data in the MDM repository iv. Work with Agency data management technical team to perform and agree on the schema mappings between master data sources and MDM repository

	Report the progress of the MDM implementation to the agency's top management
Agency data management technical team	<ul style="list-style-type: none"> i. Provide advice on the data management with regards to the technical issue at agency level <ul style="list-style-type: none"> (a) Ensure the data quality process is being implemented in handling the data at the agency level (b) Work with agency data management business team to identify the master data in the organization (c) Perform data cleansing to the identified master data before sharing them with the MDM repository (d) Prepare the quality of master data in the agency before sharing with the MDM repository (e) Work with Central (MDM repository) data management technical team to perform and agree on the schema mappings between master data sources and MDM repository (f) Report the progress of the MDM implementation to the agency's top management

ii. Top Management Support

- Prior to the implementation, the MDM initiator should notify and introduce the technology the data provider's top management to get a stronger support from them to share master data from their organizations
- Top management of the data provider agency should clear on the vision of the MDM implementation
- Top management of the data provider agency should assess the agency's capabilities in terms of human resources, expertise and infrastructure to support the MDM implementation
- Top management of the data provider agency should allocate adequate financial and human resources for the development and operation of MDM
- Top management of the data provider agency should establish continuous awareness programs for current and new personnel for continuous understanding on the benefits of the MDM implementation

- Top management of the data provider agency should provide or allocate financial budget to improve the technical skills of the personnel for the development and operation of the MDM
- MDM initiator should establish MDM continuous awareness programs for current and new top management of data steward and data provider organization in order to give continuous understanding on the benefits of the MDM implementation

iii. Technological Competence

- Data steward and data provider organizations should establish sufficient ICT infrastructure in both central and agency to support the operation of the MDM
- Data steward and data provider organizations should assign dedicated personnel to be involved in the MDM implementation
- Data steward and data provider organizations should maintain or improve the IT skill and business skill of the assigned personnel by attending MDM related courses
- MDM initiator should provide helpdesk services to data steward and data provider organizations to assist in any problem they are having in operating the MDM

C. Environmental Context

i. Citizen Demand

Prior to the MDM implementation:

- MDM initiator should perform due diligence study to justify the relevancy of the MDM development
- MDM initiator should align the purpose of the proposed MDM development with the national agenda
- MDM initiator should perform business requirement analysis together with the participation from related potential data provider organizations and citizen representatives

MDM initiator should continuously assess the MDM implementation to ensure the output of the MDM implementation is fulfilling the citizen demand on the integrated government services across multiple organizations.

AMMENDMENTS AND UPDATES

These guidelines are subjected to revisions and amendments from time to time in line with changes in technology, applications, procedures, legal and social interests.

CLOSING REMARK

Agencies that participated in the MDM implementation should comply with these guidelines in developing and operating the MDM

Appendix O

MDM Adoption Guidelines & Strategy Validation Confirmation

MDM ADOPTION AND IMPLEMENTATION GUIDELINES:

FEEDBACK FROM THE PRACTITIONER

Malaysian government currently has any guidelines for the MDM adoption and implementation in the Malaysian public sector.

Yes No Others: Please specify _____

Do you think that the Malaysian government needs an MDM adoption and implementation guidelines?

Yes No Others: Please specify _____

Do you think that it is important to have guidelines to ensure the success of MDM implementation in the Malaysian public sector?

Yes No Others: Please specify _____

Do you think the proposed guidelines from this research are suitable to be imposed in the Malaysian Public Sector in order to assist the MDM adoption and implementation?

Yes No Others: Please specify _____

You are invited to give any suggestion on the proposed guidelines:
