

Modeling of Insulin Receptor Binding & Recycling Subsystem

Presented By:

Nor Faekah Ismail

Supervisor:

Dr Lee Chew Tin

Background...

Insulin Signaling Pathway

The Actions of Insulin

Problem Statement...

- The entire insulin signaling pathway is complicated.
- It is believed that certain **breakdowns** in insulin metabolic pathway **contribute** to **Diabetes type II**.
- This problem is not well characterized due to the complexities of the system.

Objective..

- To build a metabolite **correlation model** for insulin receptor binding and recycling pathways using artificial neural network.

Scopes..

Simulation of:-

- insulin receptor binding subsystem
- insulin receptor recycling subsystem.
- **Construct and validate** insulin receptor binding and recycling subsystem **model** using **Artificial Neural Network** (MATLAB)

Insulin receptor binding & recycling subsystem

Free insulin concentration

Free receptor concentration

Intracellular receptor

2 molecule bound

1 molecule bound

Twice-bound intracellular phosphorylated

Once-bound intracellular phosphorylated

Approach..

Literature review in
insulin signaling pathway

Model & data selection

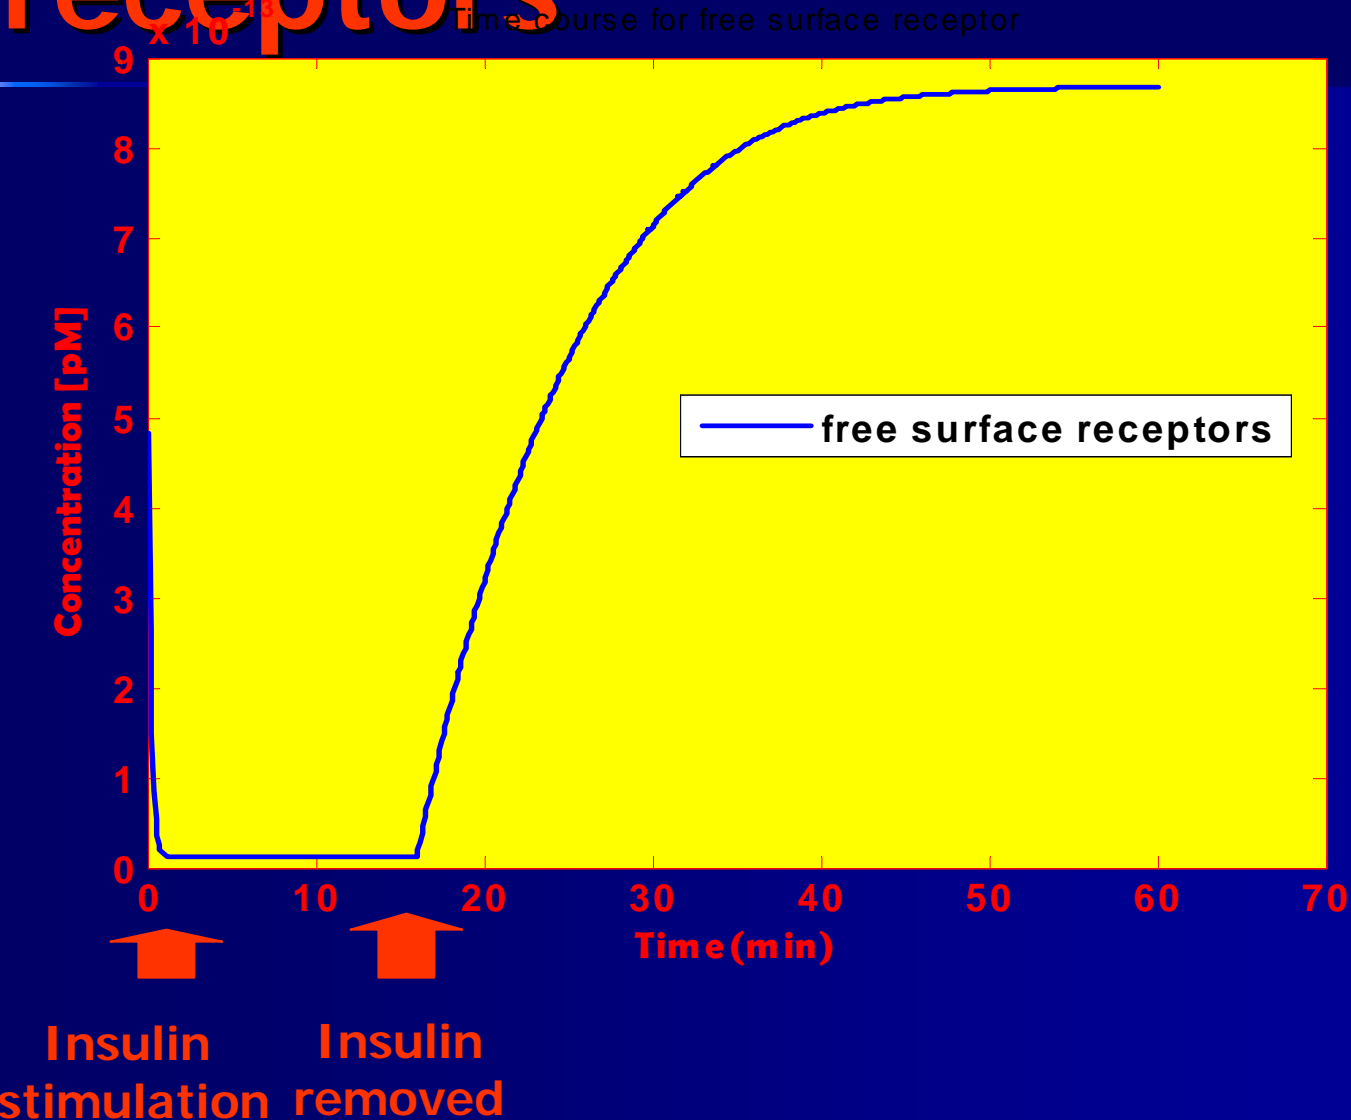

Construct model
and network (MATLAB)

Simulate data using
neural network

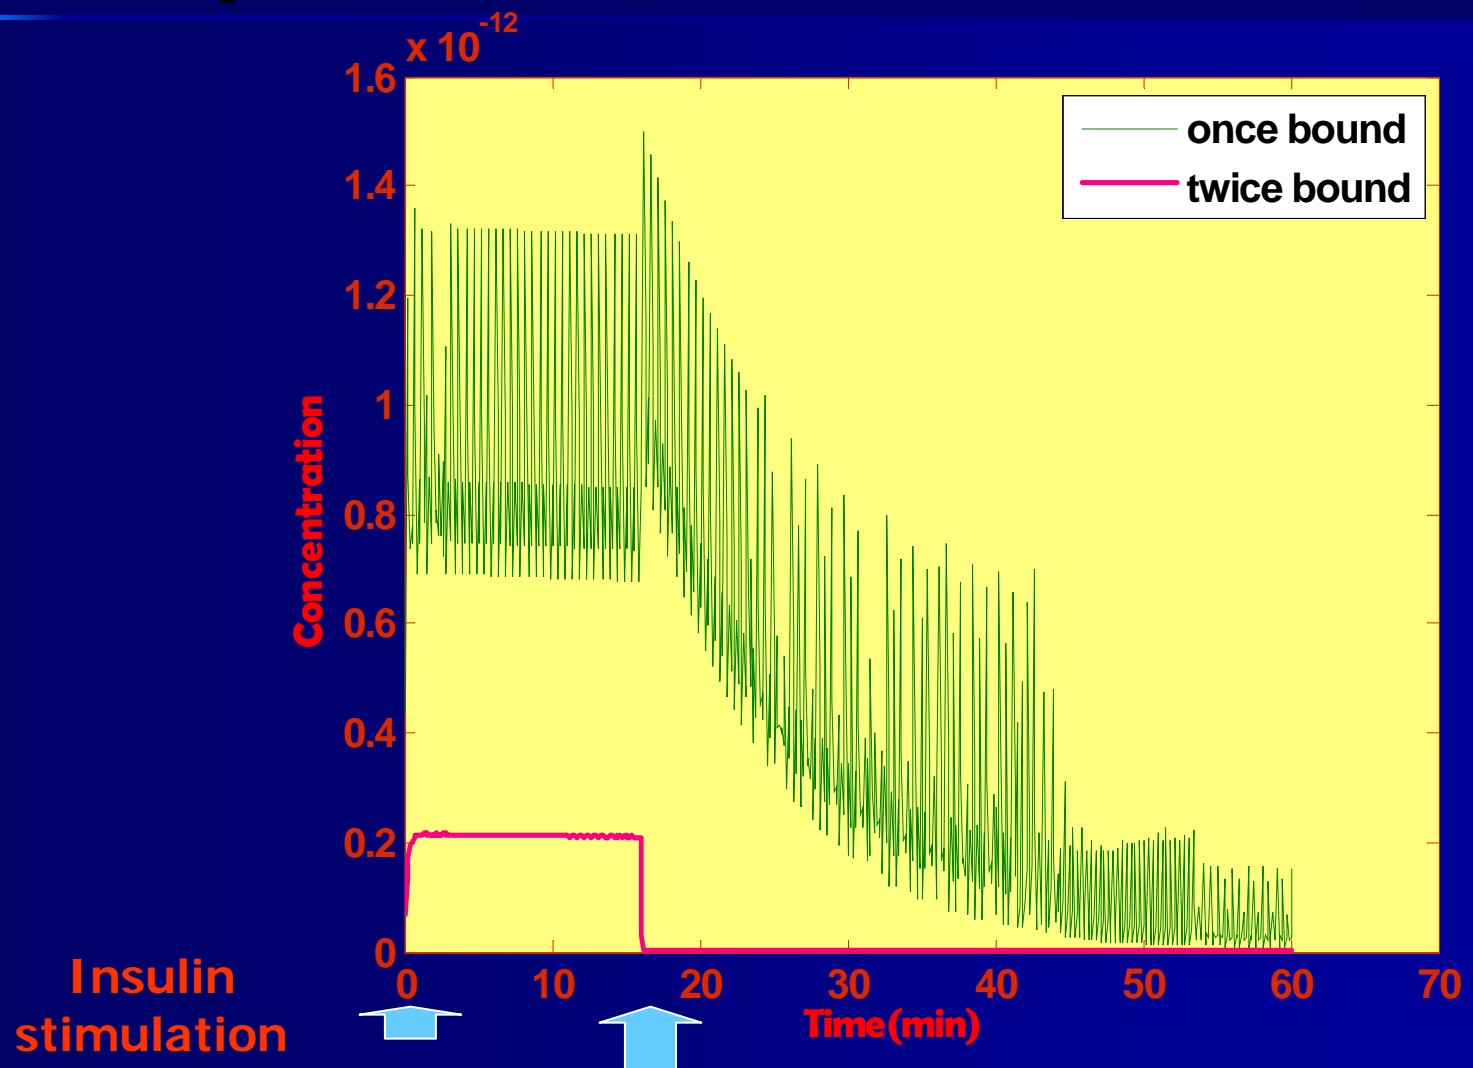

Analyze the results

Results...

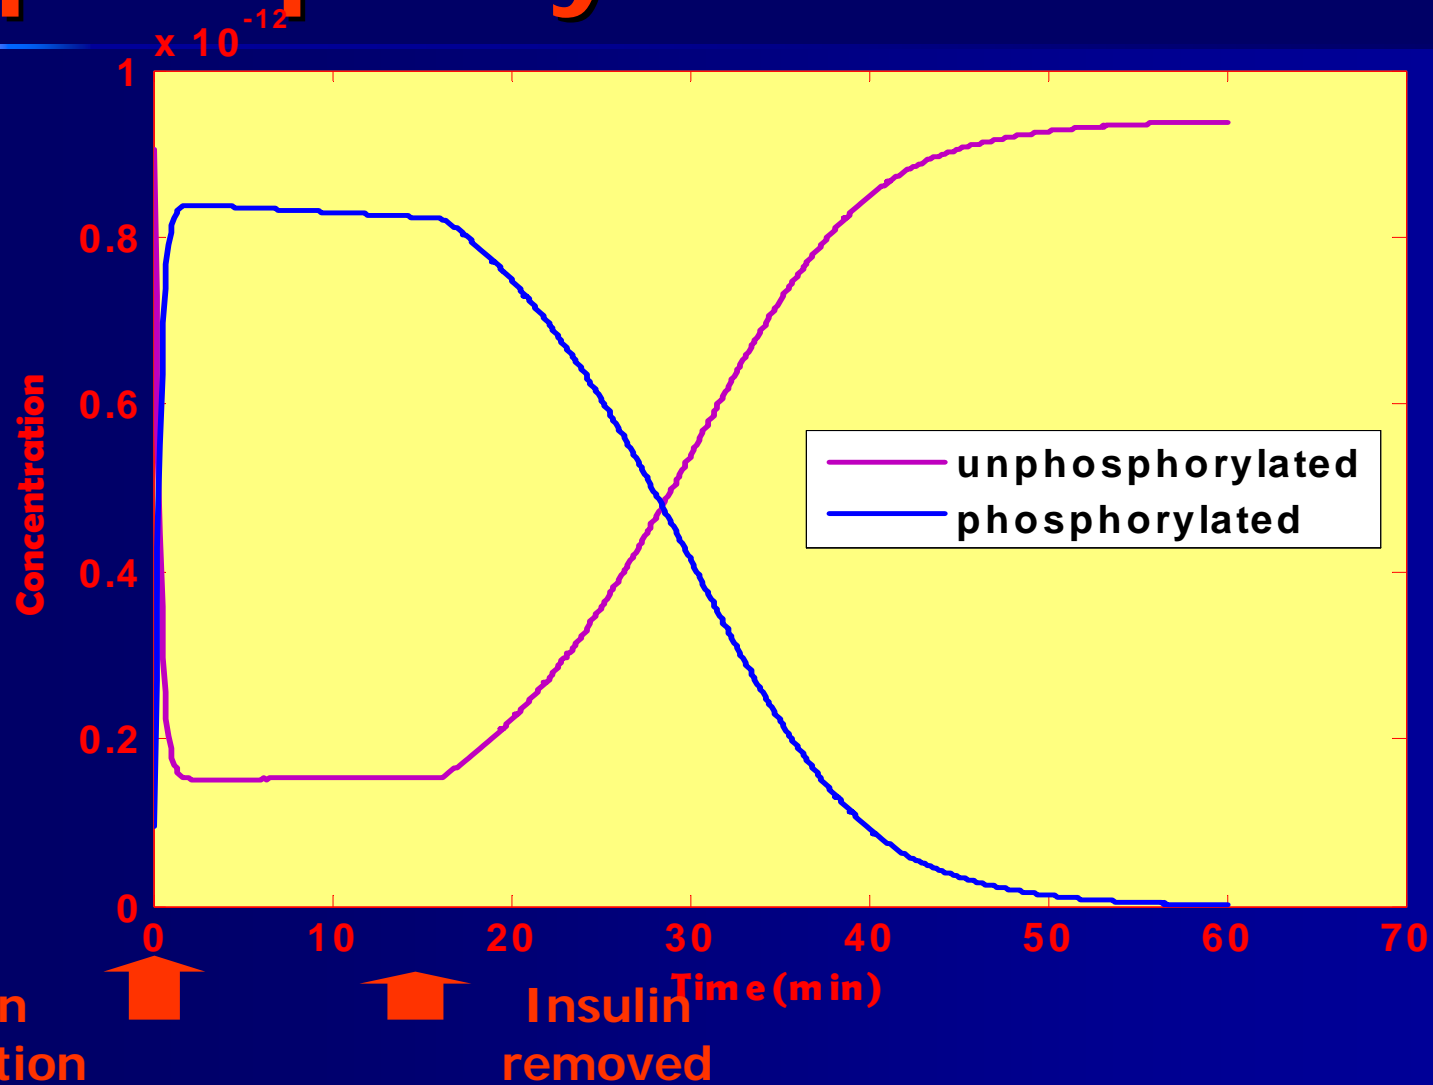

Time courses for unbound receptors

Once- & twice-bound phosphorylated surface receptors

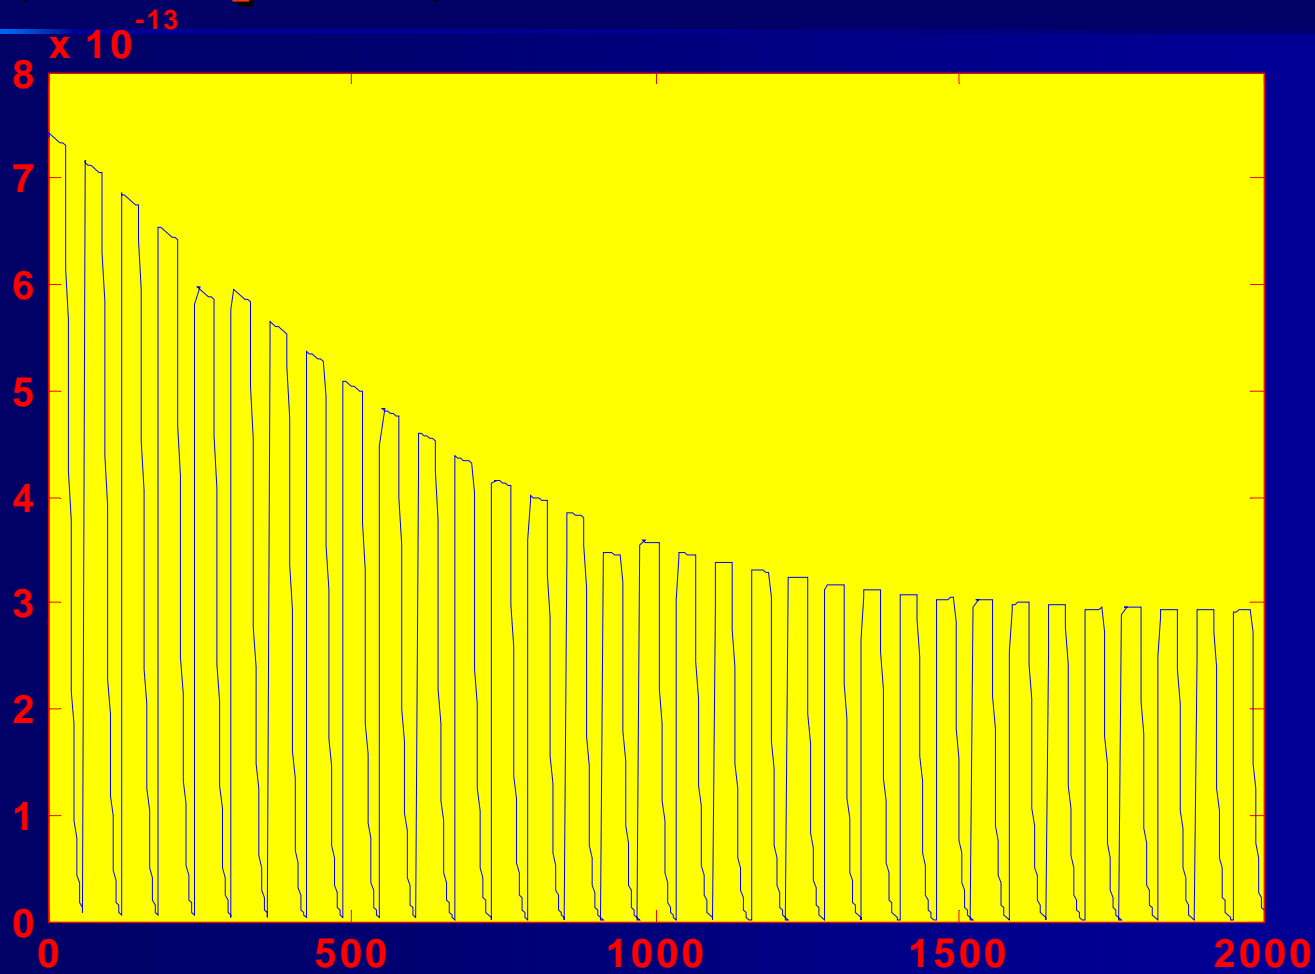

Unphosphorylated & phosphorylated IRS-1

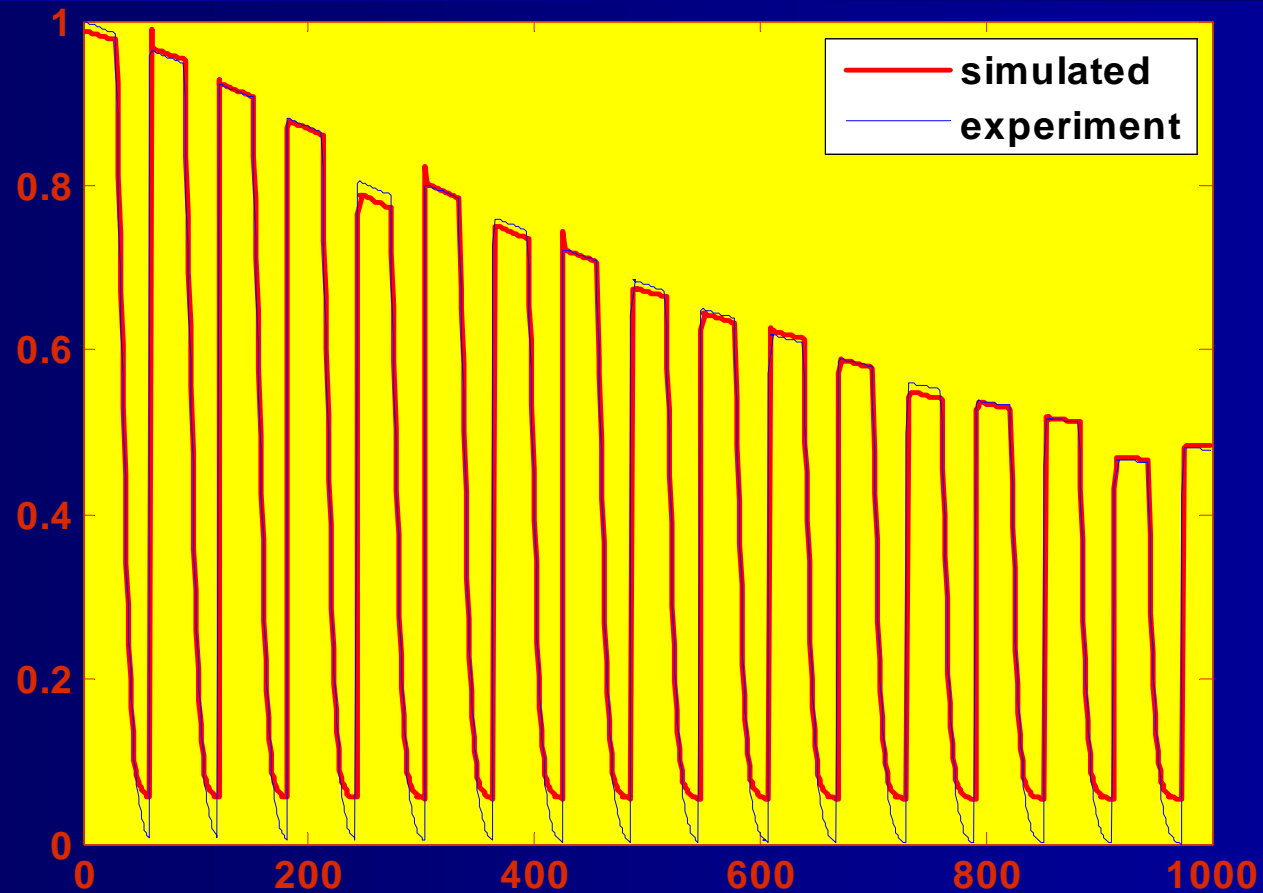

Step Change of insulin injection (input)

Step Change of IRS-1 (output)

Validation of input

Validation of output

Conclusion

- The numerical result obtained using MATLAB software are comparable with the result given in the literature.
- The errors obtained for the models developed are MSE 0.00557697/1e-005

Thank You...
