University Technology of Malaysia

JAN 2014

*To my beloved parents, brother, sisters and all my friends,
Thanks for all your love and support.*

ACKNOWLEDGEMENT

First of all, I would like to dedicate my greatest appreciation to my project supervisor, PM Dr. Munira Ismail for her guidance throughout this research. She spends a lot of time to guide me and help me in processing my thesis. My gratitude to her, her dedication has given me a learning experience in writing this thesis.

Secondly, I would also like to dedicate my appreciation to Dr. Yeak Su Hoe who had taken a lot of effort to give helpful suggestions during this study.

Moreover, I would also like to express my gratitude to my family members, especially my father and mother in encouraging me in doing this project. Their love and advice have always supported me throughout this research.

Last but not least, I would also like to thank those who have helped me directly or indirectly to complete my research, mainly my friends and course mates. They always support me by providing some information and idea and showed interest in the progress of my thesis.

Once again, I would like to convey my deepest appreciation to all of you. Thanks for your kindness and tolerance all the way.

ABSTRACT

It is common to have nonlinear systems of equations to be solved in numerical application. However, such nonlinear systems of equations are difficult to be solved either exactly or numerically. There are several methods that can be used to solve the nonlinear systems of equations numerically such as Newton's method, quasi-Newton method, and homotopy continuation method. Some numerical examples of nonlinear systems of equations are shown in this study. Further, a heat transfer process is model as a problem that nonlinear system of equations is solved with the methods that had been mentioned earlier. The numerical results are computed by using MATLAB codes and the results are compared in order to determine the accuracy of these three methods.

ABSTRAK

Sistem persamaan tak linear sering terlibat dalam aplikasi berangka. Walau bagaimanapun, sistem persamaan tak linear ini susah untuk diselesaikan sama ada dengan kaedah tepat atau kaedah berangka. Terdapat beberapa kaedah yang boleh digunakan dalam menyelesaikan masalah sistem persamaan tak linear. Sebagai contoh, kaedah Newton, kaedah kuasi-Newton, dan kaedah kesinambungan homotopi yang melibatkan sistem persamaan tak linear telah ditunjukkan dalam kajian ini. Di samping itu, proses pemindahan haba adalah sebagai satu masalah yang melibatkan penyelesaian sistem persamaan tak linear dengan menggunakan kaedah-kaedah yang disebut sebelum ini. Semua pengiraan adalah dilakukan melalui MATLAB komputer kod. Hasil pengiraan yang didapati telah dibandingkan untuk mengetahui tahap ketepatan antara tiga kaedah yang digunakan.

LIST OF SYMBOLS

\mathbb{R}^n	-	Set of ordered n-tuples of real numbers
\mathbf{x}	-	Column vector or element of \mathbb{R}^n
∇g	-	Gradient of the function g
$\mathbf{0}$	-	Vector with all zero entries
$O(\cdot)$	-	Order of convergence
\rightarrow	-	Equation replacement
δ	-	Delta
A^{-1}	-	Inverse matrix of the matrix A
A^t	-	Transpose matrix of the matrix A
$\ \mathbf{x}\ $	-	Arbitrary norm of the vector \mathbf{x}
$\ \mathbf{x}\ _2$	-	The l_2 norm of the vector \mathbf{x}
$\ \mathbf{x}\ _\infty$	-	The l_∞ norm of the vector \mathbf{x}
$A(\mathbf{x})$	-	Matrix whose entries are the functions form \mathbb{R}^n into \mathbb{R}
$J(\mathbf{x})$	-	Jacobian matrix
J_h	-	Radiosities of the heater
J_c	-	Radiosities of coating surfaces
T_h	-	Temperatures of the heater
T_c	-	Temperatures of coating surfaces
N	-	Number of subintervals

III	MATLAB Codes for Application of Nonlinear System of Equations	131

CHAPTER 1

INTRODUCTION

1.1 Background of Problem

In all areas of science and engineering, equations need to be solved. An equation of one variable can be written as

$$f(x) = 0. \tag{1.1}$$

A numerical value of x that satisfies the equation is a solution to the equation or called the root of the equation. According to Gilat and Subramaniam (2008), the value of x can be determined analytically when the equation is simple. However, it is impossible to determine the root of an equation analytically in many situations. A numerical solution of an equation is a value of x that satisfies the equation approximately. This means that the value of $f(x)$ is close to zero but not exactly zero when the value of x is substituted into the equation.

Nonlinear system in mathematics is a system that does not satisfy the superposition principle or the output of the system is not directly proportional to its input. The equation in any problem cannot be written as a linear combination of unknown variables or functions for a nonlinear system.

A linear equation in x, y, z, \dots can be written in the form

$$ax + by + cz + \dots = \text{constant} \quad (1.2)$$

with a, b, c, \dots being constant.

Below is shown the examples of linear equation.

$$2x - 6y + z = 3 \quad (1.3)$$

$$4s + t - u = -1 \quad (1.4)$$

The equations (1.3) and (1.4) are the linear equations.

An equation that consists of expressions such as

$$xy, x^2, y^{-2}, (2z - y)^2, \frac{\sqrt{x}}{y}, \cos y, e^{xz}, z\sqrt{x + y}$$

is known as nonlinear because it cannot write as a linear equation (1.2). Nonlinear equations are more difficult to be solved if compare with linear equations even the number of unknowns is small (Linz and Wang, 2003).

A nonlinear equation is a function f such that

$$f(x) = 0 \quad (1.5)$$

and the value of x for which f is zero is the root of equation, or zero of function f . This problem is known as root finding. A nonlinear equation can be solved numerically by using Newton's method, secant method, and fixed- point iteration method.

Examples of nonlinear equation are shown at below.

$$x^2 - 4\sin x = 0 \quad (1.6)$$

$$3x^2 + \sin x - e^x = 0 \quad (1.7)$$

A system of n equations and n unknowns x_1, x_2, \dots, x_n is nonlinear if exists of one or more nonlinear equations. With n unknowns, x_1, x_2, \dots, x_n , a system of n simultaneous nonlinear equations has the form:

$$\begin{aligned} f_1(x_1, x_2, \dots, x_n) &= 0, \\ f_2(x_1, x_2, \dots, x_n) &= 0, \\ &\vdots \\ f_n(x_1, x_2, \dots, x_n) &= 0. \end{aligned} \tag{1.8}$$

Following is showing an example of a nonlinear system of equations.

$$\begin{aligned} f_1(x_1, x_2, x_3) &= 3x_1 - \cos(x_2x_3) - \frac{1}{2} = 0 \\ f_2(x_1, x_2, x_3) &= x_1^2 - 81(x_2 + 0.1)^2 + \sin x_3 + 1.06 = 0 \\ f_3(x_1, x_2, x_3) &= e^{-x_1x_2} + 20x_3 + \frac{10\pi-3}{3} = 0 \end{aligned} \tag{1.9}$$

Nonlinear systems of equations appear in numerical applications frequently. The nonlinear systems of equations are usually difficult to solve, either exactly or numerically (Scheffel and Hakansson, 2009). Several methods can be used to solve a nonlinear system of equations numerically, such as Newton's methods, quasi-Newton methods, steepest descent techniques, and homotopy continuation methods.

1.2 Problem of Statement

Recently, nonlinear systems of equations have occurred in many important fields such as engineering, mechanics, medicine, chemistry, and robotics. The aim of this study is to solve nonlinear systems of equations using homotopy continuation method and compare with Newton's method and quasi-Newton method to see the accuracy of the methods. After that, apply the nonlinear system of equations in the heat transfer processes for a coating on the panel surface, and then use these three methods to get the approximation solutions.

1.3 Objective of The Study

The objectives of this research are:

- i. To solve nonlinear system of equations by using Newton's method, quasi-Newton method, and homotopy continuation method, and then compare the results of these methods.
- ii. To write computer codes of Newton's method, quasi-Newton method, and homotopy continuation method for solving nonlinear systems of equations by using MATLAB.
- iii. To apply the nonlinear systems of equations in the heat transfer processes for a coating on the panel surface and solved by using Newton's method, quasi-Newton method, and homotopy continuation method.

1.4 Scope of the Study

In this study, we will solve the nonlinear systems of equations by using several methods. Nonlinear system of equations can be solved by using Newton's methods, quasi-Newton methods, fixed-point iteration, steepest descent techniques, homotopy continuation methods, Levenberg-Marquardt methods and others. We have chosen three methods that can be used to solve the nonlinear systems. The first method is Newton's method which is the most common method for solving the nonlinear systems of equations. Then, quasi-Newton method which is modified from the Newton's method will also be used to solve the nonlinear system of equations. The last method that will use in this study is the homotopy continuation method.

There are many problems where nonlinear system of equations occurs such as engineering, mechanics, medicine, chemistry, and robotics. One application is presented in this work which is the heat transfer processes for a coating on the panel surface. This problem can be represented by a nonlinear system of equations and here the problem will be solved with these three methods. In addition, computer codes of these three methods for solving the nonlinear system of equations will be written by using MATLAB to get the numerical solutions.

1.5 Significance of the Study

Recently, nonlinear systems of equations appear in numerical applications frequently. Normally, we will use Newton's method and quasi-Newton method to solve the nonlinear systems of equations. In this study, we employ another method, homotopy continuation method to use in solving nonlinear systems of equations. So, this study will illustrate the performance of the three methods for solving nonlinear systems of equations.

In this study, we will understand more about the nonlinear system of equations that can be solved using the Newton's method, quasi-Newton method and homotopy continuation method.
