

**THE STUDY OF CAUSES AND EFFECTS OF CHANGE ORDER TO
ENGINEERING CONSULTANT PRACTITIONERS**

AHMAD SAFUAN BIN AHMAD RADZI

**A project report submitted in partial fulfillment of the requirements for the
award of the degree of Master of Science in Construction Management**

**Faculty of Civil Engineering
University Technology Malaysia**

March 2005

Specially dedicated to my beloved parents and my brothers and sisters.

ACKNOWLEDGEMENTS

In preparing this thesis, I was in contact with many people, researches, academicians, and practitioners. They have contributed towards my understanding and thoughts. In particular, I wish to express my sincere appreciation to my thesis supervisor, Associate Professor Dr. Mohamad Ibrahim Mohamad, for encouragement, guidance, critics and friendship. I am also very thankful to my superior officer at work and colleague for their guidance, advice and motivation. Without their continued support and interest, this thesis would not have been the same as presented here.

My fellow classmates should also be recognised for their support. My sincere appreciation also extends to the entire engineering consultants firms who have provided assistance at various occasions. Their views and tips are useful indeed. Unfortunately, it is not possible to list all of them in this limited space. Finally I would like to say thank you to all my family members for their continues support.

ABSTRAK

Perubahan kerja adalah merupakan suatu yang lazim dalam projek pembinaan di Malaysia. Amalan menggunakan kaedah pelaksanaan projek secara traditional dimana tanggungjawab menyediakan rekabentuk dan pembinaan yang dipisahkan telah meningkat lagi kadar berlakunya perubahan kerja didalam sesuatu projek. Terdapat berbagai punca yang menyebabkan berlakunya perubahan kerja. Walaubangaimana pun setiap perubahan kerja yang berlaku, biar apa juga puncanya tetap akan menyebabkan berlakunya perbalahan dan rasa tidak puas hati terhadap penyelesaian yang dicapai oleh pihak yang terlibat di dalam projek. Selain dari itu pengurusan perintah perubahan ini agak sukar kerana ia melibatkan perubahan atau pengurangan nilai kontrak dan pada masa yang sama melibatkan kelewatan masa penyiapan projek. Walaupun secara umum dikenalpasti perintah perubahan kerja sering kali melibatkan pihak kontraktor dan pemilik, namun implikasi perubahan kerja terhadap pihak perunding juga amat penting untuk dikenal pasti. Oleh yang demikian kajian ini telah dijalankan dengan memberi tumpuan utama terhadap menentukan punca berlakunya perubahan kerja serta kesan terhadap perunding di Malaysia. Kaedah utama yang digunakan dalam melaksanakan kajian ini adalah dengan menggunakan boring soal selidik, dimana data telah dikumpul daripada beberapa firm perunding yang terdapat di sekitar Lembah Klang. Hasil kajian ini mendapati bahawa punca utama berlakunya perubahan kerja yang melibatkan firma perunding adalah perubahan kerja yang berkaitan dengan arahan pihak penguatkuasaan yang memainkan peranan penting dalam mengawal proses kelulusan reka bentuk. Selain daripada itu punca utama lain ialah berkaitan dengan pengaruh politik, kehendak pemilik dan juga keadaan tapak yang berbeza. Kajian juga mendapati bahawa pihak perunding tidak berpuas hati dengan system untuk mereka membuat tuntutan yang diamalkan pada masa kini. Mereka berpendapat perubahan harus dilakukan. Kajian ini juga turut membut cadangan kaedah yang boleh digunakan untuk membaiki sistem membuat tuntutan untuk firm perunding.

ABSTRACT

Change order or variation order as commonly known in Malaysian construction industry is a common phenomenon in any project. The nature of traditional construction process which separated the design and construction increase the chances for change order to occur in a project. There are many causes that may lead to change order in the construction project. However no matter what is the reason for their occurrences often they resulted in dispute and dissatisfaction among the parties involved in the project with regard to their resolution. Apart from that change order also resulted in project delay and difficult to manage as they often involved in new sum of additional or deduction of contract price. In general it is commonly understood that changes is an issue that involved the contactors and the client directly. However the implication of the change order to the consultants firm is also important to be reckoned. This study has been conducted with a specific focus to determine the main causes and effects of change order in Malaysian construction environment focusing on the engineering consultant's perspective. Questionnaire survey has been conducted as the main strategy in this study methodology. Samples for the study generated from the consultants firms population within Klang Valley area. The study has determined that the major causes of the change order that involved the consultant firms are resulted from the changes originated by the authorities that regulate the design process. Other major reasons are related to political influence, client request and needs to fulfill differing site conditions. The findings from the study also revealed that the consultants are unhappy with the current practice of making claims for the change order that involved them and this need to be improved. This study further provides recommendations on methods to improve the claim procedure practiced by engineering consultants on extra works caused by change order.

CHAPTER 1

INTRODUCTION

1.1 Introduction

Building construction is a complex process, which requires close cooperation and coordination among the stakeholders. The process also consists of different stages, which ultimately make it more complicated and difficult to manage. From the view of an author Oberlander (1993), the different stages of construction projects are, inception/conceptual stage, design development (sketch and detail design), procurement, construction, testing and commissioning and operation. All the stages are important and it carries significant impact to the project. However, according to Smith (1995) design stage gives the greatest influence on the final capital cost of a project. This shows how important the design stage is.

Studies by many researches have pointed out that design plays an important role in improving the development of construction industry. A good design will enhance value generation, reduce dispute and improve the workflow. As the designing work being undertaken there are tendencies for changes in design to happen. These changes can take place right from the drawing stage up till the construction phase. The later the changes are made, the more of it will affect the project.

In the actual design environment, changes inevitably and continuously affect the properties of many building components at various stages in a construction

project. Such changes may occur due to the needs to satisfy the new or modified requirements specified by the owner, to reduce project cost, or to rectify existing design mistake (Wang and Soh, 2000). To make things worse most of the changes were made during construction stage. These will generate change orders, contractual disputes, cost overrun, time delay, compromising on quality and frustration. In addition to that parties which are involved in the process of making the changes into reality will need to submit fresh claims on the extra work done.

1.2 Problem Statement

Change order is known as one of the major setbacks for construction projects. They are many factors that contribute to the changes and the effects of such are also varied depending on its causes. As for designers, changes mean extra work and these extra works are liable for them to claim. However, there are difficulties in doing so, generally because of problems such as complexity in quantifying the value and lack of guidelines on the matter.

1.3 Objective of the Study

The study is aimed to provide an understanding of what causes change order and their relative effects to the engineering consulting firms. In addition it will also look into the nature of claims made by the designers and suggest some improvement on the current practice.

The main objectives of the study are:

1. To identify the main causes of change order in construction projects from the engineering consultants point of view;
2. To identify the resulting effects of change order to the practitioners of engineering consulting firms; and

3. To provide suggestion on how to improve the claim procedure practiced by engineering consultants on extra works caused by change order.

1.4 Scope and Limitation of the Study

The study was confined itself within the following scopes:

1. It is only focusing on the causes and effects of change order from engineering consultant perspective.
2. The respondents involved were only the engineering consultants from Klang Valley area.
3. The suggestion made is only focusing on method the to improve claim procedures for the engineering consultant practitioners.

There are guidelines on the fees or claims that need to be paid to the consultants in performing their duties as designers. Example of such is the schedule of fees which was produced by the Board of Engineers Malaysia. However, this guideline is lacking in the area of claims that related to rework or extra work caused by change order. Thus, it is the aim of this study to look at the normal practice that used by Malaysian consulting engineering firms in the mentioned task.

1.5 Brief Research Methodology

This research started off with problem identification which done through unstructured interview and brief literature reading. Upon obtaining the identified problem thorough literature review were conducted to provide in depth understanding on the issues of change order, focusing on the causes and effects to engineering consultants practitioners. The literature includes books, dissertations, magazines, journals, newspapers readings and seminar notes. Apart from the literature review, the study was also conducted using questionnaire surveys that were

sent out to respective engineering consultant organisations. The objective of the survey is to obtain more extensive coverage of the Malaysian scenario on the issue of change order and claims made by engineering consultants on extra works caused by change order. Upon obtaining the data desired, checking and sorting of data were done and followed by data analysis which was the main component of the research. Finally from the data analysis acquired conclusion and recommendation were made. Figure 1.1 shows the flowchart of the research methodology.

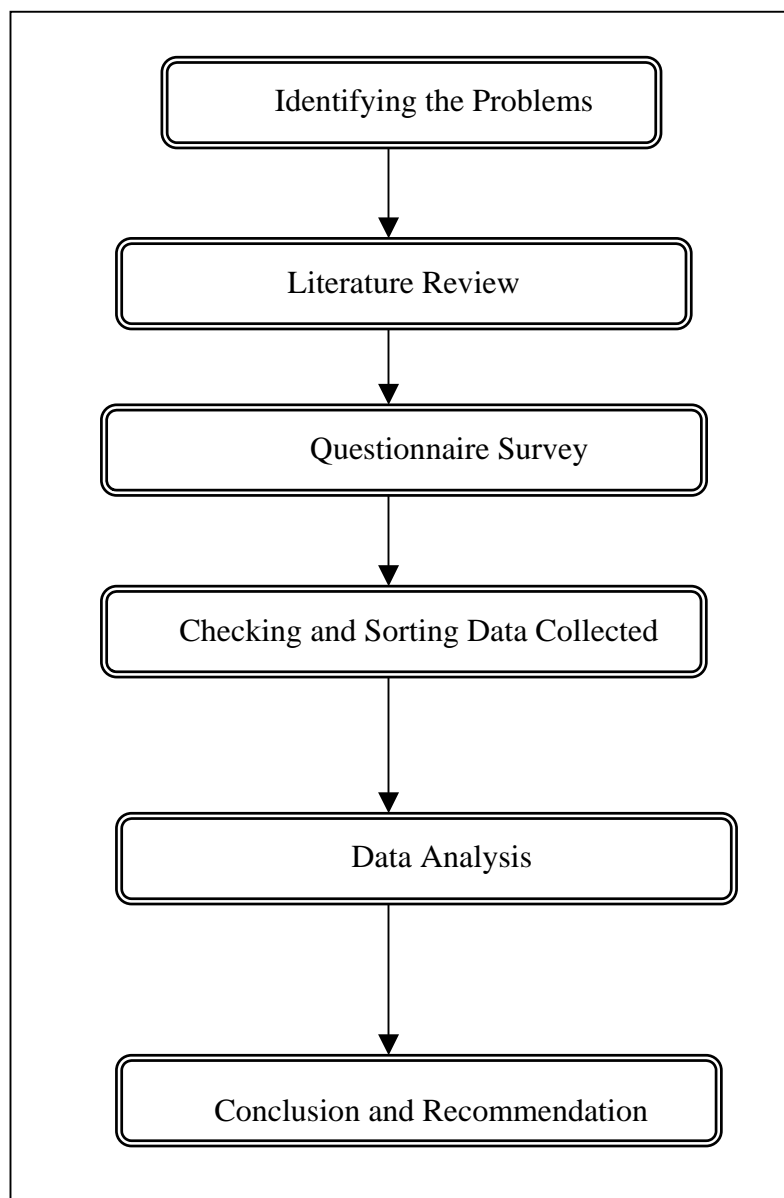

Figure 1.1 Flowchart of brief research methodology

1.6 Structure of Dissertation

The dissertation is divided into 7 Chapters. The first chapter discusses on the objectives, scope and limitation of the study, and brief research methodology adopted to fulfill the objectives of the study.

Chapter 2 discusses on the issues of change order, its causes and the effects. Understanding on the causes of change order were established and as a result the effects of it were recognised as well. Furthermore the methods of claims made by the consulting engineers on the extra works caused by change order were being looked into in Chapter 3.

While in Chapter 4 it discussed in detail the research methodology adopted for the study. The approach to the questionnaire design is explained and the flowchart of research methodology was shown.

The findings from the survey questionnaire are analysed in Chapter 5. The respondents for the questionnaires were only those from the Civil and Structural Engineering Consulting firm and from the Mechanical and Electrical Engineering Consultants organisations. In Chapter 6, the research findings are thoroughly discussed.

Chapter 7 concludes the study and makes recommendations to the construction industry for future research on the issues of change order and claims by the engineering consultants.
