

SOFTWARE DEVELOPMENT FOR THE EVALUATION OF THE LIGHTNING
PROTECTION SYSTEM DESIGN

RAVEEN KUMAR RAMALINGAM

A project report submitted in partial fulfilment of the
requirements for the award of the degree of
Master of Engineering (Electrical - Power).

Faculty of Electrical Engineering
Universiti Teknologi Malaysia

JUNE 2014

To my beloved
Family and Friends,

To my supervisor,
Assoc. Prof. Dr. Zulkurnain Abdul-Malek

To all my supportive members,

Thank for your support and sacrifices

ACKNOWLEDGEMENT

I would like to express my many thanks to my supervisor of this project, Dr. Zulkurnain Abdul-Malek for the inspiration and guidance in this project. He has constantly provided valuable guidance and advice which has motivated me to contribute my fullest to this project.

In addition, gratitude is dedicated to my family and close friends who has been all the way tolerating and helping me in providing moral and technical support during the course of this project. Their constant support has greatly motivated me to continuously put in effort towards the completion of this project.

Finally, I would like to thank all my friends for their friendship and their support, which made this journey a joyful and unforgettable. Thanks.

ABSTRACT

Due to the high lightning activity in Malaysia, a good and robust lightning protection system (LPS) is required and this system has to be evaluated based on actual influencing parameters. This work describes the development and results of a computer based software for the evaluation of lightning occurrences on a structure. Lightning Protection System Design is a software that allows designers to design a lightning protection system for a particular building or structure. The work discusses on the relevant algorithms to compute the lightning strike probability on a given structure. The program was written in Python and a very simple guided user interface using Visual Basic.NET. It also provides the flow chart in designing and computing the protection system. The software is based on 3 dimensional modeling implementing the electro geometrical model of lightning stroke on the structures that requires protection. The work also evaluates different building structure with different protection levels to calculate the probability of lightning strike.

ABSTRAK

Kertas ini menerangkan pembangunan dan keputusan perisian berasaskan komputer untuk penilaian kejadian kilat untuk struktur. Sistem Perlindungan Kilat Design adalah perisian berasaskan program yang membolehkan pereka untuk mereka bentuk sistem perlindungan kilat untuk bangunan atau struktur tertentu. Kertas ini akan membincangkan algoritma berkenaan untuk kilat mogok kebarangkalian pada struktur. Program ini ditulis dalam Python dan antara muka pengguna yang amat mudah dipandu menggunakan Basic.NET Visual. Ia juga akan menyediakan carta alir dalam mereka bentuk dan pengiraan sistem perlindungan. Perisian ini adalah berdasarkan kepada 3 model dimensi melaksanakan model elektro geometri sambar kilat ke atas struktur yang memerlukan perlindungan. Oleh kerana aktiviti kilat yang tinggi di Malaysia, sistem perlindungan kilat yang baik dan teguh (LPS) diperlukan dan sistem ini perlu dinilai berdasarkan parameter mempengaruhi sebenar. Kertas ini juga menilai struktur bangunan yang berbeza dengan tahap perlindungan yang berbeza untuk mengira kebarangkalian kilat.

CHAPTER 1

INTRODUCTION

Lightning is a natural phenomenon which is unavoidable and as of great concern for mankind. The effects of lightning including impacting human safety, electronics devices and AC power system equipment failure. [1].

Due to the high thunderstorm days recorded in Malaysia, probability of lightning striking in Malaysia is relatively high. [3]Therefore, since it is unavoidable, a proper lightning protection system is required for structures, buildings and AC power system related equipment. This is to prevent any hazard or electrical nuisance tripping due to lightning impulse current

1.1 Background

For this project, literature review on the ground flash density (GFD) and the thunderstorm days in Malaysia is to be done. These values are vital for lightning protection system design and determine the amount of lightning strike on a structure.

Furthermore, statistical methods such as probability density function are being utilized to perform the random calculation along with other algorithms. A few case studies were done to evaluate the software and the effectiveness of lightning protection system (LPS). Any assumptions or conclusions upon evaluating are discussed further in the report.

1.2 Problem Statement

Malaysia has generally high thunderstorm days due to its location at the equator. This resultant in having more lightning activity across Malaysia and higher probability of lightning striking on buildings compared to other countries.

Hence, a good and robust lightning protection system (LPS) is required to arrest the lightning and providing the best path to be grounded. Currently, consultants prefer to use rule of thumb and 2D drawings to design the placement of lightning arrestors.

Design is basically done on placing at the edges of building and according to cost or budget given. Some consultants only use rolling sphere method which only gives results of possible point of strikes and no information on probability of strikes at the individual points. Neither proper risk evaluation nor lightning simulation are done to structures before designing the LPS.

This has been the motivation for the project in order to provide a better protection system against lightning for mankind. Besides that, most of the software available is more suitable for overhead transmission lines.

1.3 Objectives

The objectives of this project are;

- To develop a software which able to design a lightning protection system for a building based on actual lightning characteristics.
- To develop algorithm of lightning simulation
- To study on the inclusion of lightning protection and the effectiveness level based on protection levels or locations.

1.4 Scope of study

The scope of study of this project covers the following;

- To understand the algorithm of lightning striking and implementation
- To evaluate the LPSD with various structure with different levels of protections and provide advice on protection level
- To determine probability of lightning striking with varying building height and area
