

PERFORMANCE OF SASOBIT MODIFIED ASPHALT BINDER IN WARM-MIX
ASPHALT TECHNOLOGY

SHAHAB MOEINI FEIZABADI

A project report submitted in partial fulfillment of the
requirements for the award of the degree of
Master of Engineering (Civil- Transportation and Highway)

Faculty of Civil Engineering
Universiti Teknologi Malaysia

January 2014

Families are the compasses that guide us. They are the inspiration to reach great heights, and our comfort when we occasionally falter. “Brad Henry”

To my father, mother and wife for your sacrifices...

AKNOWLEDGEMENT

I would like to express my very great appreciation to Dr. Md. Maniruzzaman B. A. Aziz for his helps and supervisions in this research project. His attention and support played a very important role in the shaping of this work.

Special thanks dedicated to HoD of JGP Professor Dr. Mohd Rosli Hainin and head of highway laboratory Dr. Norhidayah Abdul Hassan for their cooperation and permission for working in the lab even at weekends.

My special thanks are extended to SHELL, Singapore for donation of testing asphalt binders.

Many thanks are also due to laboratory technicians of UTM and UTHM for their cooperation during the lab works. I am grateful to all my colleagues, friends, staff, and lecturers in Universiti Teknologi Malaysia.

Lastly, I thank my parents, my wife and dear friends Mr Hamzeh Ali Poorbagher and Mr Manouchehr Shokri for their constant encouragement without which this study would not be possible.

ABSTRACT

Road maintenance is widely recognized, but not adequately maintained due to economic crisis of countries. Besides, increasing emission of greenhouse gases is an environmental issue, and it is a great concern to curb this problem from further harm to the environment and living things have captured attention of many parties, including pavement industries. Warm-mix asphalt (WMA) technologies could address the deterioration issues, reduce escalated energy costs, decrease global warming, reduce air pollution and increase environmental awareness. These matters have brought attention to the potential benefits of WMA in the developing countries. WMA technologies allow significant lowering of the production and paving temperature compared to conventional HMA (Hot-Mix Asphalt). In HMA production, the quarry mixing temperature is equivalent of asphalt's viscosity of 170cP (0.17Pa.s), and gets sufficient fluidity to coat all the aggregates properly, whereas paving temperature is equivalent of a viscosity of 280cP (0.28Pa.s). Sasobit is an organic additive of warm mix asphalt technology, which used in this study as an asphalt binder modifier. The rates of sasobit were from 0.4% to 3.2% with interval 0.4 by mass of the asphalt binder. Two types of penetration asphalt binder (800-100 and 60-70) were used. The tests which conducted were penetration test, Rotational Viscosity (RV) test and Dynamic Shear Rheometer (DSR) test. In addition, The Rolling Thin Film Oven (RTFO) and the Pressure Aging Vessel (PAV) simulate the asphalt binder's short-term aging and long-term aging respectively. Moreover, complex shear modulus (G^*) was determined for finding the rutting factor ($G/\text{Sin}\delta$) and fatigue factor ($G^*.\text{Sin}\delta$) for both asphalt binders. This study illustrates the optimum rate of sasobit is between 2.8 and 3.2% by weight of the asphalt binder.

ABSTRAK

Penyelenggaraan jalan diiktiraf secara meluas, tetapi ianya tidak dijalankan dengan baik disebabkan oleh krisis ekonomi sesebuah negara.. Selain itu, pelepasan gas rumah hijau merupakan salah satu isu alam sekitar, dan ia adalah satu masalah yang sukar untuk dibendung daripada membahayakan alam sekitar dan ini telah menarik perhatian banyak pihak termasuk industri pembuatan jalan. Teknologi asphalt campuran suam (Warm Mix Asphalt, WMA) boleh menangani isu-isu kerosakan jalan, mengurangkan kos tenaga, mengurangkan pemanasan global, mengurangkan pencemaran udara dan meningkatkan kesedaran tentang alam sekitar. Perkara-perkara ini telah membawa perhatian kepada potensi WMA di negara-negara membangun. Teknologi WMA boleh mengurangkan pengeluaran dan suhu turapan berbanding asphalt campuran panas (Hot -Mix Asphalt, HMA). Dalam pengeluaran HMA , suhu pencampuran di kuari adalah bersamaan kelikatan asphalt 170cP (0.17Pa.s) , dan mendapat sifat kecairan yang cukup untuk menyalut semua agregat dengan betul, manakala suhu turapan adalah sama dengan kelikatan 280cP (0.28Pa.s). Sasobit adalah bahan tambahan organik kepada teknologi WMA yang digunakan dalam kajian ini sebagai pengubahsuaian pengikat asphalt. Kadar sasobit adalah dari 0.4% kepada 3.2% dengan selang 0.4 oleh jisim pengikat asphalt. Dua jenis kadar penembusan asphalt pengikat (800-100 dan 60-70) telah digunakan. Ujian yang dijalankan adalah ujian penembusan (penetration test), ujian putaran Kelikatan (Rotational Viscosity, RV) dan ujian dinamik ricih reometer (Dynamic Shear Rheometer, DSR). Di samping itu, Rolling Thin Film Oven (RTFO) dan Pengandung Tekanan Penuaan yang (Pressure Aging Vessel, PAV) masing-masing menunjukkan penuaan jangka pendek dan penuaan jangka panjang pengikat asphalt. Selain dari itu , modulus ricih kompleks (G^*) digunakan untuk mencari faktor aliran ($G^*/\text{Sin}\delta$) dan faktor keletihan ($G^*.\text{Sin}\delta$) bagi kedua-dua pengikat asphalt. Kajian ini menunjukkan kadar optimum sasobit adalah antara 2.8 dan 3.2 % mengikut berat pengikat asphalt.

CHAPTER 1

INTRODUCTION

1.1. Background of the Study

The need of understanding the effects of global warming and air pollution have been realised worldwide. Furthermore, increasing emission of greenhouse gases is an environmental issue, and it is a great concern to curb this problem from further harm to the environment and living things have captured attention of many parties, including pavement industries. Warm-mix asphalt (WMA) is one of those efforts to curb a reduction in the temperature at which asphalt mixes are produced and placed.

Primary experiments on warm-mix asphalt technology were started in European countries by 1995.¹ Since 1997, over 142 projects were paved using Sasobit® totalling more than 2,271,499 square meters of pavement. Projects were constructed in Austria, Belgium, China, Czech Republic, Denmark, France, Germany, Hungary, Italy, Macau, Malaysia, Netherlands, New Zealand, Norway, Russia, Slovenia, South Africa, Sweden, Switzerland, the United Kingdom, and the United States.² By 2002, NAPA started a study tour to Europe. Between years 2002 and 2007 NAPA, NCAT and AASHTO published some research on WMA technology including sasobit.¹

Sasobit is produced by Sasol Wax Company in South America and Germany. It is also known as FT paraffin wax or asphalt flow improver. Sasobit is completely soluble in asphalt binder. Sasobit has different effect on asphalt binder viscosity. Above its melting point the wax reduces the binder viscosity but observed at lower temperature

ranges, when the asphalt binder is in the colloid or the solid phase, which asphalt binder viscosity increases.²

The effect of wax depends on the chemical composition and the rheological characteristics of the asphalt binder, the composition crystallinity of the wax, the application temperature range, and the amount of wax.² In addition, sasobit blending rate is very important and past research show that more than 4% sasobit content has a damaging effect on asphalt binder.³ That is why, in some countries such as Germany, France, and China, the amount of wax in the asphalt binder is restricted.²

1.2. Problem Statement

Asphalt binder plays an important role in road construction as a typical binder. In this process, heating is required to handle bitumen due to its high viscosity. Unfortunately, this fact involves some energetic, environmental and health problems like fume emissions. Furthermore, modern traffic with a large number of trucks and increased tire pressure, offers a serious challenge to the design, construction and maintenance of asphalt pavements through of the world. Around one billion USD is spent annually for the repair of potholes. In addition, each particular failure mechanism is a function of asphalt's basic intermolecular chemistry. Currently, not enough asphalt chemical knowledge to adequately predict performance. That is why physical properties and tests are used. Until now, we are unable to know the chemical formula for asphalt binder.

1.3. Objectives of the Study

The main research objectives of this research are:

- i. The effect of Short-term and long-term aging on the penetration and viscosity of asphalt binders 80-100 and 60-70

- ii. The effect of various percentages of sasobit on the penetration and viscosity of the original (unaged), short-term and long-term aged asphalt binders 80-100 and 60-70 and finding the viscosity of high temperature asphalt binders 80-100 and 60-70 at different aging phases.
- iii. Illustrating the $G^*/\text{Sin}\delta$ (rutting factor) and $G^*.\text{Sin}\delta$ (fatigue factor) of above asphalt binders at different temperatures.
- iv. Determining the optimum application rate of sasobit in both asphalt binders due to penetration, viscosity, fatigue and rutting factor

1.4. Scope of the project

The effect of sasobit on different aging phases was investigated in this research. In Malaysia, use of 80-100PEN is very common. However, the 60-70 PEN is recommended in the new JKR specification. In this study these two types of penetration asphalt binders evaluated with sasobit modification which, both of them were brought from SHELL, Singapore. Figure 1.1 shows the asphalt binder 60-70 using in this study. The dosages of sasobit were from 0.4 to 3.2 with interval 0.4 by mass of asphalt binder. Figure 1.2 illustrates the sasobit of this project. Short-term and long-term aging were simulated with the Rolling Thin Film Oven test (RTFO) and the Pressure Aging Vessel test (PAV) respectively. Penetration test, Rotational Viscosity test (RV) and Dynamic Shear Rheometer (DSR) were used to determine some physical and rheological properties of virgin and modified asphalt binder. It should be noted that DSR tests were done in highway laboratory of Universiti Tun Hussein Onn Malaysia (UTHM).

1.5. Thesis Organisation

This thesis is divided into five chapters. Chapter 1 provides a general overview of the study. Literature review on Warm-mix asphalt technology and discussion about modifies sasobit asphalt binder is presented in Chapter 2. The experimental set up and techniques used are explained in Chapter 3. All the

experiments data and results are presented in Chapter 4. The finding and discussion about the results also presented in this chapter. Finally, Chapter 5 is the conclusion and recommendation for future work. Figure 1.3 illustrates the discussion flowchart of this study.
