## **ACKNOWLEDGEMENT**

I would like to express my deepest appreciation to my supervisor, Professor Dr. Tharek bin Abdul Rahman for his patience, guidance and advise during the course of this project.

Moreover, I would like to extend my gratitude to all my friends for their opinions, advises and time for making this project successful.

Finally, I would like to thank my dearest family members for being very understanding and supportive.

## ABSTRACT

WCDMA system is meant for high data rate transmission such as implementation of the third generation (3G) mobile system. Any mode of mobile transmission is not free from channel impairment such as noise, interference and fading. These channel impairments caused signal distortion and degradation in signal to noise ratio (SNR). Thus one method to overcome this problem is by introducing channel coding in the mobile transmission system. Convolutional coding with coding rate =  $1/2$  is a standard determined by the 3GPP committee for the 3G system. In order to visualize the effect of convolutional coding in communication channel, simulation method of the WCDMA system is carried out. Thus computer simulation software, MATLAB has been used to evaluate the performance of convolutional coding in AWGN and Multipath Rayleigh Fading channel. Further analysis and discussion is made based on the results obtained. In general, channel coding has improved bit error rate of WCDMA system. However, as the speed of mobile terminal increases the capability of channel coding also degrades. Thus it is suggested that implementation of interleaver to improve quality of the system.

## ABSTRAK

Pemodulatan Pembahagian Kod Pelbagai Capaian Lebar Jalur Luas (Wideband Code Division Multiple Access, WCDMA) adalah digunakan untuk transmisi data capaian tinggi seperti aplikasi sistem bergerak generasi ketiga (3G). Secara amnya, sebarang transmisi sistem bergerak adalah tidak terlepas daripada kerosakan saluran yang disebabkan oleh kebisingan, gangguan dan kepudaran isyarat. Kerosakan saluran ini menyebabkan pengherotan isyarat dan juga pengurangan terhadap nisbah isyarat kebisingan (signal to noise ratio-SNR). Salah satu cara untuk mengatasi masalah ini adalah dengan memperkenalkan kod saluran kepada transmisi sistem bergerak. Kod konvolusi dengan kadar kod =  $1/2$  merupakan standard yang telah ditetapkan oleh Jawatankuasa 3GPP untuk sistem bergerak generasi ketiga. Dalam mengkaji kesan kod konvolusi terhadap saluran komunikasi, simulasi terhadap sistem WCDMA telah dijalankan. Oleh itu, sistem simulasi MATLAB telah digunakan untuk menilai prestasi kod saluran terhadap saluran yang terdiri daripada Pertambahan Bunyi Hingar Putih Gaussian (AWGN) dan kelenturan pelbagai laluan Rayleigh (Multipath Rayleigh Fading). Analisa dan perbincangan lanjut telah dijalankan ke atas keputusan-keputusan simulasi yang diperolehi. Secara amnya, kod komunikasi mempunyai keupayaan untuk memperbaiki nilai kesilapan bit (bit error rate-BER) di dalam sistem WCDMA. Walau bagaimanapun, keupayaan kod komunikasi untuk memperbaiki BER berkurangan dengan pertambahan kelajuan terminal bergerak. Oleh itu, adalah dicadangkan penggunaan '*interleaver*' untuk memperbaiki kualiti sistem

## **CHAPTER 1**

### **INTRODUCTION**

#### **1.1 Project Background**

The objective of digital communication is to propagate signal from the transmitter to the receiver. However, the communication channel is not free from the effects of channel impairments such as noise, interference and fading. These channel impairments caused signal distortion and signal to ratio (SNR) degradation.

One method that can be implemented to overcome this problem is by introducing channel coding. Channel encoding is applied by adding redundant bits to the transmitted data. The redundant bits increase raw data used in the link and therefore, increase the bandwidth requirement. So, if noise or fading occurred in the channel, some data may still be recovered at the receiver. While at the receiver, channel decoding is used to detect or correct errors that are introduced to the channel.

Wideband Code Division Multiple Access (WCDMA) is a standard established by IMT- 2000 in order to support higher data rates transmission for mobile system. This new standard is also employs channel coding in the communication link for better performance. Convolutional coding is one of the channel coding techniques which have been specified for WCDMA system.

## **1.2 Problem Statement**

Multipath fading is a common phenomenon in mobile communication. It results from multipath propagation, reflection, refraction and diffraction. It caused communication environment changes quickly and thus introduces more complexities and uncertainties to the channel response. One known solution is by introducing channel coding in communication environment. Convolutional coding is used in WCDMA system due to its relatively good performance and with reasonably simple Viterbi decoding algorithm.

## **1.3 Project Objectives and Scope of Work**

The aim of this project is to study the error performance of WCDMA system for convolutional coding in presence of Rayleigh multipath fading channel for single user environment. Thus three main objectives have been outlined, which are:

1. To investigate the effect of convolutional coding with different channel condition in WCDMA system
2. To simulate the system with different channel conditions which are Additive White Gaussian Noise (AWGN) and Rayleigh Multipath Fading with Doppler Shift.
3. To analyze BER for the simulated WCDMA system.

In order to achieve the objectives above, this project has been carried out totally based on simulation using Matlab software. Matlab is used to generate and calculate bit error rate (BER) and signal to noise ratio (SNR) for each predetermined channel condition.

#### **1.4 Thesis Outline**

This thesis is organized into six chapters. Chapter 1 provides an overview of the project which includes project background and objectives.

Chapter 2 gives in depth explanation on WCDMA system design that relates to the project scope, while Chapter 3 deals with the basic knowledge of channel coding of the system.

Chapter 4 covers the simulation methodology used in the project which based on Matlab software. Detailed explanation of the WCDMA model used in the

simulation is also presented which including the transmitter, receiver and channel design.

Chapter 5 presents the results and analysis of the simulation. The results of each WCDMA model are analyzed. Each subsection is ended by some discussion on the results.

Chapter 6 concludes the project with some suggestions on future development and conclusion on the work conducted throughout the project.

study between those coding schemes is essential to determine which coding scheme is more suitable for a system with different channel conditions.

5. It is also proposed that implementation of interleaver in the system in order to overcome the problem of irreducible error rate.
