MARCH 2016

To my beloved mother and father

ACKNOWLEDGEMENT

The opportunity for this Newcastle University International Singapore (NUIS) and Universiti Teknologi Malaysia (UTM) Joint-PhD research would have been impossible without the initial effort, support and encouragement of my beloved supervisor from Universiti Teknologi Malaysia (UTM), the late Prof. Dato' Dr. Marzuki Khalid, who did not get the opportunity to see the fruit of his initiative, to him I am most indebted and grateful. In preparing this thesis, I was involved with many academicians and researchers who have contributed a lot to my understanding and thoughts. I wish to express my profound and sincere appreciation to the most important person in this research, my NUIS supervisor, Prof. Dr. Ehsan Mesbahi, for his endless unforgettable support, encouragement, guidance and critics. Without him, this thesis would not have been completed and presented. I am also very thankful to my supervisor from UTM, Prof. Datin Dr. Rubiyah binti Yusof, for her invaluable advice, guidance and motivations in this research.

I would also like to extend my sincere appreciations to my fellow postgraduate friends, researchers and staff of NUIS and Center for Artificial Intelligence and Robotics (CAIRO), UTM Kuala Lumpur for their support and advice, especially to Mrs. Azlin binti Ahmad. Her views and tips are useful indeed. Many thanks to Universiti Kuala Lumpur Malaysia France Institute (UniKL MFI) for their support and financial assistance. My special appreciation also extends to all my colleagues and others who have provided various forms of assistance. Last but not least, I would also like to extend my greatest appreciation to my beloved parents for their spiritual support, of which without I would be lost. My lovely wife, Mardewee Endut, who has been my pillar of strength, her love and understanding encourages me to strive for the success of this PhD. I am also very grateful to all my children and family members for their understanding of my commitment in this research and thesis preparation. I hope they will be inspired to succeed in their life as well.

ABSTRACT

This thesis presents a number of investigations leading to introduction of novel applications of intelligent algorithms in the fields of informatics and analytics. This research aims to develop novel methodologies to reduce dimensions and clustering of highly non-linear multidimensional data. Improving the performance of existing methodologies has been based on two fundamental approaches. The first is to look into making novel structural re-arrangements by hybridisation of conventional intelligent algorithms which are Auto-Associative Neural Networks (AANN) and Self Organizing Maps (SOM) for data clustering improvement. The second is to enhance data clustering and classification performance by introducing novel fundamental algorithmic changes known as M3-SOM in the data processing and training procedure of conventional SOM. Both approaches are tested, benchmarked and analysed using three datasets which are Iris Flowers, Italian Olive Oils and Wine through case studies for dimension reduction, clustering and classification of complex and non-linear data. The study on AANN alone shows that this non-linear algorithm is able to efficiently reduce dimensions of the three datasets. This paves the way towards structurally hybridising AANN as dimension reduction method with SOM as clustering method (AANNSOM) for data clustering enhancement. This hybrid AANNSOM is then introduced and applied to cluster Iris Flowers, Italian Olive Oils and Wine datasets. The hybrid methodology proves to be able to improve data clustering accuracy, reduce quantisation errors and decrease computational time when compared to SOM in all case studies. However, the topographic errors showed inconsistency throughout the studies and it is still difficult for both AANNSOM and SOM to provide additional inherent information of the datasets such as the exact position of a data in a cluster. Therefore, M3-SOM, a novel methodology based on SOM training algorithm is proposed, developed and studied on the same datasets. M3-SOM was able to improve data clustering and classification accuracy for all three case studies when compared to conventional SOM. It is also able to obtain inherent information about the position of one data or "sub-cluster" towards other data or sub-cluster within the same class in Iris Flowers and Wine datasets. Nevertheless, it faces difficulties in achieving the same level of performance when clustering Italian Olive Oils data due to high number of data classes. However, it can be concluded that both methodologies have been able to improve data clustering and classification performance as well as to discover inherent information inside multidimensional data.

ABSTRAK

Tesis ini membentangkan beberapa rangkaian penyelidikan yang membawa kepada pengenalan aplikasi baharu untuk algoritma pintar dalam bidang informatik dan analisis. Kajian ini bertujuan untuk membangunkan kaedah-kaedah baharu untuk mengurangkan dimensi dan pengugusan data berbilang dimensi dan bukan linear. Peningkatan prestasi kaedah sedia ada dibuat berdasarkan kepada dua pendekatan asas. Yang pertama ialah dengan memberi penekanan kepada kaedah baharu penyusunan semula struktur-struktur algoritma melalui penghibridan algoritma pintar konvensional iaitu Rangkaian Neural Automatik Bersekutu (*Auto-Associative Neural Networks* (AANN)) dan Peta Swaorganisasi (*Self Organizing Maps* (SOM)) bagi tujuan peningkatan prestasi pengugusan data. Yang kedua ialah bagi tujuan peningkatan prestasi pengugusan dan penkelasian data dengan memperkenalkan perubahan baharu terhadap kerangka pemprosesan data dan prosedur latihan di dalam algoritma konvensional SOM. Kedua-dua pendekatan ini diuji, ditanda aras dan dianalisis dengan menggunakan tiga set data bunga Iris, minyak zaitun Itali dan Wain melalui beberapa kes-kes kajian untuk mengurangkan dimensi, pengugusan dan klasifikasi data yang kompleks dan bukan linear. Kajian terhadap AANN sahaja menunjukkan algoritma bukan linear ini mempunyai keupayaan pada tahap ketepatan yang tinggi untuk mengurangkan dimensi ketiga-tiga set data tersebut. Ini membuka jalan ke arah penggabungan struktur AANN sebagai kaedah pengurangan dimensi dengan SOM sebagai kaedah pengugusan data (AANNSOM) bagi tujuan peningkatan pengelompokan data. Penghibridan algoritma AANN dan SOM (AANNSOM) diperkenalkan dan digunakan dalam kes-kes kajian pengelompokan data set-set data bunga Iris, minyak zaitun Itali dan Wain. Metodologi hibrid terbukti dapat meningkatkan ketepatan pengelompokan data, mengurangkan kesilapan pengkuantuman dan mengurangkan kerumitan pengiraan berbanding SOM dalam semua kajian kes. Walaubagaimanapun, kesilapan topografi didapati tidak konsisten disepanjang kajian dan ianya masih sukar bagi kedua-dua AANNSOM dan SOM untuk memberikan maklumat tambahan yang wujud di dalam set-set data seperti kedudukan sebenar sesuatu data di dalam kelompok. Oleh itu, metodologi M3-SOM yang berdasarkan algoritma latihan SOM adalah dicadangkan, dibangunkan dan dikaji pada set data bunga Iris, minyak zaitun Itali dan Wain. M3-SOM mampu meningkatkan prestasi ketepatan pengelompokan dan klasifikasi data untuk ketiga-tiga kajian kes berbanding konvensional SOM. Ia juga mampu untuk mendapatkan maklumat yang wujud mengenai kedudukan salah satu data atau "sub-kelompok" ke arah data lain atau sub-kelompok dalam kelas yang sama untuk set-set data bunga Iris dan Wain. Walau bagaimanapun, ia menghadapi kesukaran untuk mencapai tahap prestasi yang sama untuk kelompok data minyak zaitun Itali kerana bilangan kelas data yang tinggi. Walaubagaimanapun, boleh disimpulkan bahawa kedua-dua kaedah telah dapat meningkatkan prestasi pengugusan dan klasifikasi data serta menemui maklumat yang wujud di dalam data berbilang dimensi.

LIST OF TABLES

TABLE NO.	TITLE	PAGE
2.1	Input data matrix of 150 Iris Flowers data. Each of them has four attributes (Sepal Length, Sepal Width, Petal Length and Petal Width). The dataset has three classes of flowers: Setosa, Versicolor and Virginica. Sp_n indicates the n th data of Iris Flowers	38
2.2	Input data matrix of 572 Italian olive oils data. Each of them has eight attributes namely Palmitic, Palmitoleic, Stearic, Oleic, Linoleic, Eicosanoic, Linolenic and Eicosenoic. There are nine classes: North Apulia, Calabria, Sicily, Inner Sardinia, Coastal Sardinia, East Liguria, West Liguria, Umbria and South Apulia	41
2.3	Input data matrix of 178 Wine data. Each of them has thirteen attributes namely Alcohol (A1), Malid Acid(A2), Ash(A3), Alcalinity of Ash(A4), Magnesium(A5), Total Phenol(A6), Flavanoids(A7), Non Flavanoids Phenol(A8), Proantocyanins(A9), Colour Intensity(A10), Hue(A11), OD2809/D315(A12) and Prolines(A13). There are three classes: Class-1, Class-2 and Class-3	43
3.1	The results of AANN data clustering accuracy for Iris Flowers	61
3.2	The results of AANN data clustering accuracy of Italian Olive oils	63
3.3	The results of AANN data clustering accuracy of Wine	65
4.1	Input data matrix of s_{pn} data with its attributes number, a	72

4.2	The weight w_{ij} associated to output layer N_p . v is the number of output neurons and is equalled to dimension-X multiplies dimension-Y (SizeX x SizeY)	72
4.3	Different type of neighbourhood and learning rate functions used in SOM as described in [75]	74
4.4	The qe , te and computational time obtained in fifteen experiments of Iris Flowers clustering using SOM and AANNSOM-2BN	82
4.5	The average quantisation and topographic errors in SOM and AANNSOM-2BN when clustering Iris Flowers dataset. %diff indicates the percentage of different errors obtained in AANNSOM-2BN compared to SOM	84
4.6	Data clustering accuracy of Iris Flowers clustering using SOM	85
4.7	Data clustering accuracy of Iris Flowers clustering using AANNSOM-2BN	86
4.8	The comparison of data clustering accuracy in clustering Iris Flowers data between SOM and AANNSOM-2BN. %diff indicates the difference of AANNSOM-2BN accuracy compared to SOM. Avg is the average of %diff	88
4.9	Quantisation and topographic errors of Italian Olive oils clustering using SOM, AANNSOM-5BN and AANNSOM-2BN. The computational time taken have also been measured	91
4.10	The average quantisation and topographic errors in SOM, AANNSOM-5BN and AANNSOM-2BN when clustering Italian Olive oils dataset. %diff indicates the percentage of changes compared to SOM's qe and te	93
4.11	Data clustering accuracy of Italian Olive oils using SOM	95
4.12	Data clustering accuracy of Italian Olive oils using AANNSOM-5BN	96
4.13	Data clustering accuracy of Italian Olive oils using AANNSOM-2BN	97
4.14	The average data clustering accuracies of Italian Olive oils dataset using SOM, AANNSOM-5BN and AANNSOM-2BN	99

4.15	Quantisation and topographic errors in fifteen experiments of Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	103
4.16	The average quantisation and topographic errors in SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN when clustering Wine dataset. %diff indicates the percentage of changes compared to SOM's <i>qe</i> and <i>te</i>	106
4.17	The computational time for Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	107
4.18	Data clustering accuracy of Wine using SOM	109
4.19	Data clustering accuracy of Wine using AANNSOM-10BN	110
4.20	Data clustering accuracy of Wine using AANNSOM-6BN	111
4.21	Data clustering accuracy of Wine using AANNSOM-2BN	112
4.22	The average data clustering accuracies of Wine dataset using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	115
5.1	Number of data systematically and randomly selected in training and testing datasets of Iris Flowers, Italian Olive oils and Wine datasets	128

LIST OF FIGURES

FIGURE NO.	TITLE	PAGE
1.1	The framework of the research	6
2.1	The steps in knowledge discovery consist of data cleaning, data integration, data selection, data transformation, data mining, pattern evaluation and knowledge presentation processes as illustrated in [2]	11
2.2	The seven sequential steps of data clustering as described in [34]	19
2.3	Clustering procedure of K-means as described in [2]	22
2.4	Example of clustering using K-means technique when number of clusters is equal to three ($k=3$)	22
2.5	The process of agglomerative and divisive in hierarchical clustering as described in [2]. Agglomerative Nesting (AGNES) represents agglomerative process to merge clusters while Divisive Analysis (DIANA) represents divisive process that split clusters into several levels	24
2.6	Example of hierarchical clustering where clustered display of data from time course of serum stimulation of primary human fibroblasts as described by [40]	25
2.7	Top figure shows graphical illustration of PCA subspace from its input vectors while bottom images show PCA application in determining human genome expression as described in [56]	27
2.8	Graphical representation of the projection of Iris Flowers dataset on two first principal components of PCA as described in [19]	28

2.9	The grid cell structure of Grid-based method as described in [67]	30
2.10	An example of SOM showing that the output layer at the top consists of a two-dimensional lattice made up of X multiplies Y output neurons. The x_i represents the input vectors while w_{ij} are the weights associated to between input and output neurons	34
2.11	Iris Flowers data clustering using SOM with known classes (left) and “unknown” classes (right). The clusters and its boundaries are difficult to be distinguished in the latter case	36
2.12	Matrix plots of the attributes of Iris Flowers dataset	39
2.13	The geographical locations of Italian Olive oils samples as described in [24]	40
2.14	Matrix plots of the attributes of Italian olive oils dataset	42
2.15	Matrix plots of the attributes of Wine dataset. The attributes are Alcohol (A1), Malid Acid(A2), Ash(A3), Alcalinity of Ash(A4), Magnesium(A5), Total Phenol(A6), Flavanoids(A7), Non Flavanoids Phenol(A8), Proantocyanins(A9), Colour Intensity(A10), Hue(A11), OD2809/D315(A12) and Prolines(A13)	44
3.1	Functional unit or neuron of the network. x_i is n-dimensional input and w_i is an n-dimensional weight with $i = \{1, \dots, n\}$	48
3.2	Structure of AANN that consist of 3 nodes at input and output layers, 5 nodes at map and de-map layers and 2 nodes at bottleneck layer	49
3.3	The trained-AANN consist on compression network and decompression network	54
3.4	The trained-AANN-compression networks. The final weights are obtained after the training of the whole AANN is completed	55
3.5	Example of AANN data clustering accuracy on Iris Flowers data. One test data (Test-Vgnca) is considered as misclassified while others (Test-Setosa and Test-Vsclr) are correctly classified	56

3.6	The clustering of whole Iris flowers dataset defined by the one activation node at bottleneck layer in AANN	58
3.7	The clustering of whole Iris flowers dataset defined by the two activation nodes at bottleneck layer in AANN	59
3.8	The AANN clustering of 120 training data and 30 testing data of Iris flowers. Large numbers of test data are well clustered closer to its own classes	59
3.9	The AANN clustering of 60 training data and 90 testing data of Iris flowers. Large numbers of test data are well clustered closer to its own classes even though the number of training data is smaller than the number of testing data	60
3.10	The performance of data clustering accuracy of AANN in clustering Iris Flowers dataset according to the number of training and testing data used. % change indicates the different performance of AANN with two bottleneck nodes (2BN-Iris) compared to AANN with one bottleneck node (1BN-Iris)	61
3.11	The AANN clustering of Italian Olive oils dataset defined by two bottleneck nodes. The data labels are: NApu for North Apulia; Cala (Calabria); Sici (Sicily); ISar (Inland Sardinia); CSar (Coastal Sardinia); ELig (East Liguria); WLig (West Liguria); Umbr (Umbria) and SApu (South Apulia)	62
3.12	The performance of data clustering accuracy of AANN in clustering Italian Olive oils dataset according to the number of training and testing data used.% indicates the different performance of AANN with two bottleneck nodes (2BN-Olive) compared to AANN with one bottleneck node (1BN-Olive)	63
3.13	The AANN clustering of Wine dataset defined by two bottleneck nodes. The dataset has three classes: Class-1, Class-2 and Class-3	65
3.14	The performance of data clustering accuracy of AANN in clustering Wine dataset according to the number of training and testing data used.% indicates the different performance of AANN with two bottleneck nodes (2BN-Wine) compared to AANN with one bottleneck node (1BN-Wine)	66
4.1	Structure of SOM showing the output layer at the top consists of a 2D lattice which made up of X multiplies	

	Y output neurons (SizeX x SizeY). The x_i represents the input vectors while w_{ij} are the weights associated between input and output neurons	71
4.2	Framework of hybrid AANN and SOM (AANNSOM)	77
4.3	SOM data clustering accuracy. Two test data are considered as misclassified while others are correctly classified. The first one (g) is located on the wrong cluster (should be c only) while the second one (c) is located on neuron that should not have any data. Both data are considered as misclassified data	78
4.4	Iris Flowers clustering using SOM	81
4.5	Iris Flowers clustering using hybrid AANNSOM-2BN	81
4.6	qe in fifteen experiments of Iris Flowers clustering using SOM and AANNSOM-2BN	83
4.7	te in fifteen experiments of Iris Flowers clustering using SOM and AANNSOM-2BN	83
4.8	Computational time for Iris Flowers clustering using SOM and AANNSOM	84
4.9	Data clustering accuracy for Iris Flowers clustering using SOM in fifteen number of experiments in each experiment type (T-1 until T-8)	87
4.10	Data clustering accuracy for Iris Flowers clustering using AANNSOM-2BN in fifteen number of experiments in each experiment type (T-1 until T-8)	87
4.11	The average data clustering accuracies for Iris Flowers clustering using SOM and AANNSOM-2BN	88
4.12	Italian Olive oils clustering using AANNSOM	90
4.13	qe in fifteen experiments of Italian Olive oils clustering using SOM, AANNSOM-5BN and AANNSOM-2BN	92
4.14	te in fifteen experiments of Italian Olive oils clustering using SOM, AANNSOM-5BN and AANNSOM-2BN	93
4.15	The computational time of Italian Olive oils clustering using SOM, AANNSOM-5BN and AANNSOM-2BN in fifteen experiments	94

4.16	Data clustering accuracy for Italian Olive oils clustering using SOM in fifteen number of experiments in each experiment type (T-1 until T-8)	98
4.17	Data clustering accuracy for Italian Olive oils clustering using AANNSOM-5BN in fifteen number of experiments in each experiment type (T-1 until T-8)	98
4.18	Data clustering accuracy for Italian Olive oils clustering using AANNSOM-2BN in fifteen number of experiments in each experiment type (T-1 until T-8)	99
4.19	Data clustering accuracy of Italian Olive oils clustering using SOM, AANNSOM-5BN and AANNSOM-2BN	100
4.20	Wine clustering using AANNSOM	102
4.21	<i>qe</i> in fifteen experiments of Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	104
4.22	<i>te</i> in fifteen experiments of Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	105
4.23	The computational time of Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN in fifteen experiments	107

4.27	Figure 4.27: Data clustering accuracy for Wine clustering using AANNSOM-2BN in fifteen number of experiments in each experiment type (T-1 until T-8)	114
4.28	Data clustering accuracy of Wine clustering using SOM, AANNSOM-10BN, AANNSOM-6BN and AANNSOM-2BN	115

- 5.1 Example of Iris Flowers data clustering using SOM. During training, neighbourhood functions expand the distributions of winning neurons representing class boundaries from the class centres (left). Once the training is completed, data are then mapped on these winning neurons (right) 122
- 5.2 The grouping of the data of the same classes onto several output neurons 123
- 5.3 Different characteristics of neighbourhood functions (Bubble (a), Gaussian (b), Cut-Gauss (c) and Epanechnikov (d) as described in [75]) on 8x8 SOM map. The higher the curves indicate that the changes or updates are large while low curves indicate small changes or updates 124
- 5.4 Comparison between the characteristics of M3 equation with four other neighbourhood functions (Bubble, Gaussian, Cut-Gauss, Epanechnikov [75]). The higher the curves indicate that the changes or updates are large while low curves indicate small changes or updates. All functions depend on the value of neighbourhood radius ((a)=7;(b)=4;(c)=1) with respect to time except for M3 function 125
- 5.5 The ordinary SOM's data clusters (left). The clustering of data using Stage-1 (right) 126
- 5.6 3D representation of data in M3-SOM. The data are arranged according to their computed distances in matrix of distances D from smaller (lower positions) to higher (upper positions) 127
- 5.7 Iris Flowers clustering using SOM (left) and Stage-1 (right). M3-SOM has been able to group most of the data into three different classes 130
- 5.8 Iris Flowers clustering using SOM. Class: Setosa (label 0-49); Versicolor (50-99); Virginica (100-149) 131
- 5.9 Vertical representation of the three classes of Iris Flowers data using M3-SOM. The positions of the data in M3-SOM are ordered according to their minimum computational distances in matrix of distances (D). The lower the values the lower the positions of the data while higher values represent data at higher positions 133

5.10	Vertical representation of the three classes of Iris Flowers data using M3-SOM. The positions of the data in M3-SOM are ordered and positioned based on the exact computational distances in matrix of distances (D)	135
5.11	M3-SOM's representation (lower part) of the positions of the data of three classes of Iris Flowers compared to their respective locations in SOM map. When compared to SOM, these data are situated at the centre of clusters for the three classes of Setosa, Versicolor and Virginica	136
5.12	M3-SOM's representation of the positions of the data (farthest ones) for the three classes of Iris flowers data compared to their respective locations in SOM map. When compared to SOM, these data are mostly situated at the boundaries of the clusters for the three classes of Setosa, Versicolor and Virginica	137
5.13	Data clustering accuracy of Iris Flowers using M3-SOM and SOM with different neighbourhood functions (Bubble, Cut-Gauss, Gaussian and Epanechnikov). The accuracies are reduced when the number of training data decreases	140
5.14	Italian Olive oils clustering using SOM	141
5.15	Italian Olive oils clustering using Stage-1	142
5.16	The lower part (left) and upper part (right) of M3-SOM represents the clustering of Italian Olive oils	144
5.17	Data clustering accuracy of Italian Olive oils data using M3-SOM and SOM with different neighbourhood functions (Bubble, Cut-Gauss, Gaussian and Epanechnikov). The accuracies are reduced when the number of training data decreases	146
5.18	Wine clustering using SOM (left) and Stage-1 (right). M3-SOM has been able to group most of the data into three different classes	147
5.19	Wine clustering using SOM. Class: Class-1 (label 0 - 58); Class-2 (label 59 - 129); Class-3 (label 130-177)	148

- 5.20 Vertical representation of the three classes of Wine data using M3-SOM. The positions of the data in M3-SOM are ordered according to their minimum distances in matrix of distances (D). The lower the values the lower the positions of the data while higher values represent data at higher positions 149
- 5.21 The lower part of M3-SOM represents the data that are mostly situated at the cluster centres in SOM 151
- 5.22 The upper part of M3-SOM that represent the data that are mostly situated at the cluster boundaries in SOM 152
- 5.23 Data clustering accuracy of Wine data using M3-SOM and SOM with different neighbourhood functions (Bubble, Cut-Gauss, Gaussian and Epanechnikov). The accuracies are reduced when the number of training data decreases 154

LIST OF APPENDICES

APPENDIX	TITLE	PAGE
A	Number of data systematically and randomly selected in training and testing datasets of Iris Flowers, Italian Olive oils and Wine datasets for AANN, SOM, AANNSOM and M3-SOM clustering, classification and visualization case studies.	176
B	The matrix of distances D . All values represent the distances between data and their respective output neurons. The circles indicate the minimum distance between them. The data/sample is then mapped to this nearest neuron.	177

CHAPTER 1

INTRODUCTION

1.1 Introduction: Background and Motivation

Since the dawn of modern time, humans have usually been attracted in how nature functions, including themselves. This understanding has allowed mankind to reproduce certain forms of nature functions and to extend human limitation. An inspiring example is escaping gravitation; (in other words: flying), and the human race is currently increasingly fascinated in reproducing one of the most important features of nature: *intelligence*. Human has shown the ability to copy or learn from nature. Many existing inventions today are originated from the certain forms of nature or biological system. The flying ability of bird creates idea and path for human to invent aeroplane, robotic arm is replicated from human arm as well as barcode is devised from the uniqueness of finger thumb print and other inventions originated from features of nature. *Intelligence* however is one the features of nature that is not physically exist but can be studied and modelled. This unique feature inspires human to study about it, understand it and create machines or systems that could imitate it. This would become the artificial features of nature or artificial learning mechanisms for these machines or systems and is commonly known as Artificial Intelligence (AI). The learning ability of natural *intelligence* in clustering, classifying and recognizing objects or patterns that could reveal any form of inherent information motivates the author to initiate this research in intelligent machine learning algorithm in the field of informatics and analytics aiming to develop novel methodologies for reducing dimensions and clustering of highly non-linear multidimensional data.

Knowledge discovery has become one of the most challenging fields of study nowadays. Over the years, many works have started with the purpose of learning the machine to explore, discover and understand knowledge and information that could be beneficial for us. The need to extract information and knowledge from a huge pool of abundant and complicated data structures is enormous. It can be considered as one of the most important characteristics of the information age. The incredible development and advancement in Information Technology (IT), in particular the Internet, have led us into a technological situation that can be called "data explosion". The aspect of data availability has been increased much more than the assimilation capacity of any normal human being. According to a study conducted at Digital Universe Study [1], the amount of generated data in particular digital data have grown exponentially in the last decade and will continue to grow by 50-fold by the year 2020. This massive increase in both the volume and the variety of data demands for advances in methodology to understand, process, interpret and summarize the data. According to [2], we are overloaded by many types of data such as scientific data, medical data, financial data etc. These data require huge amount of time and demand vast attention. As a result, efforts must be taken by us to find ways to automatically: analyse the data, cluster or classify them, summarize them, discover and characterize trends or patterns in them, and identify abnormalities. Researches in statistics, visualization, artificial intelligence and machine learning are contributing to this one of the most active areas of database research community.

From a more technical point of view, understanding the structure of multidimensional datasets arising from the data explosion is very important in data mining, data clustering, pattern recognition, and machine learning. This would enable us to obtain additional inherent information about the datasets. However, it would be difficult, costly and time consuming to acquire new knowledge from databases that are larger and complicated if it is done manually. It may even be not viable when the data exceed certain limits of size and complexity. Therefore, the automated analysis and visualisation of multidimensional datasets has become the focus of many scientific research with the objective is to find uniformities and relationships in the data. This could gain access to useful knowledge or inherent information that could be hidden inside the data. AI technique of Artificial Neural

Networks (ANN) can be considered as one of the promising tools in this field. Inspired by advances in biomedical research, ANN forms a class of algorithms aiming to simulate the biological neural networks. One of the well-known ANN algorithm, the Self-Organizing Maps (SOM) has become one of the most popular unsupervised learning algorithms. Created in the early 1980s by Finnish Professor Teuvo Kohonen, the work or research related to the algorithm, visualization and application of SOM has been published in more than 5000 research articles according to [3]. The algorithm comprehensively visualise natural groupings and relationships in the data and has been successfully applied in a wide variety of research areas such as image processing, speech recognition, life sciences, bio-informatics to financial analysis to name few.

SOM algorithm performs a non-linear projection of multidimensional data onto a two dimensional display. The mapping is topology-preserving which means that the more identical or similar two data are in the input space, the closer they will appear together on the final map. This allows the user to identify clusters such as large groupings of a certain type of input pattern. What features the members of a cluster have in common could also be revealed through additional examination. It is an efficient tool in information visualisation. The basic implementation of SOM is simple and the map representation is easy to understand. Furthermore, the results are reliable and the algorithm scales exceptionally well. In many studies and applications, SOM has proved to be excellent in helping in visualising and understanding the data.

Regardless of its popularity and ability to cluster multidimensional data, SOM has shown some issues and limitations with regards to its structure and visualization performances. The inherent information about one particular data with respect to other data, a sub-cluster, or an unknown data, have been often difficult to be interpreted and understood. Sever shortcomings in interpreting data clusters and the difficulties to distinguish different data classes using SOM particularly when the data are unknown, complex or non-linear have stirred the motivation for this research.

1.2 Aim and Objectives of the Research

The aim of this research is to devise a new paradigm of analytics using hybrid and complementary algorithmic methodologies for clustering data with complex, non-linear and unknown inherent structures.

The objectives of the research are as follows:

1. To review the strengths and weaknesses of various techniques for dimension reduction and clustering data with complex and non-linear characteristics.
2. To identify suitable datasets with non-linear characteristics for dimension reduction and clustering as Case-studies for implementation of proposed methodologies.
3. To improve the ability of the existing methodologies for dimension reduction techniques.
4. To develop new training methodologies for clustering, classifying and visualizing data with complex, non-linear and unknown structures.

1.3 Scope of the Research

The scope of the research is limited to the review of literature, study, development and analysis related to data mining, dimension reduction techniques, clustering algorithms and multidimensional datasets.

1.4 Research Framework and Contributions

1.4.1 Introduction

This research focuses on the studies, developments and enhancements of dimension reduction, clustering and classification of data with complex, non-linear and unknown structures. This research is carried out throughout the incremental steps which begin from the review of various dimension reduction and clustering techniques to the re-development and analysis of these techniques, and to the development and analysis of the proposed enhanced techniques for data clustering and classification.

1.4.2 Research Framework

The framework of the research is described as the following steps (Figure 1.1) and organized according to Chapter 2, Chapter 3, Chapter 4 and Chapter 5 of the thesis. The steps are:

1. The review of dimension reduction and clustering techniques is described in Chapter 2.
2. The re-development of AANN and the study and analysis on it's ability to reduce dimension of multidimensional data is described in Chapter 3.
3. The development of hybrid AANN and SOM and the study and analysis on it's clustering performances is presented in Chapter 4.
4. The development of M3-SOM and the study and analysis on it's clustering and classification performances is presented in Chapter 5.

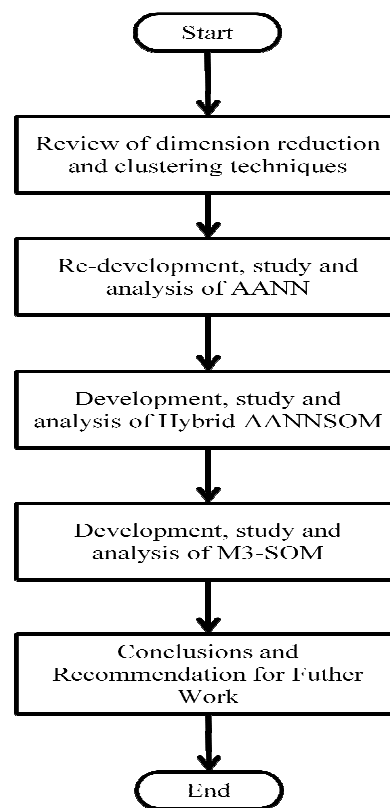

Figure 1.1 The framework of the research

1.4.3 Research Contributions

The contributions of the research are as follows:

1. The development and study of a new computational methodology based on SOM training algorithm. The detail investigations on SOM training algorithm specifically on it's neighbourhood functions, weights updates process and matrix of distances, lead to the creation of a new methodology in SOM data clustering, classification and visualization. This new methodology provides more inherent information about multidimensional data such as it's ability to identify the closest data, the farthest data or the group of data that may form a group of sub-clusters in the same class.

2. The development of hybrid AANNSOM algorithm for multidimensional data clustering. This algorithm is a combination of supervised learning and dimension reduction method of AANN with unsupervised learning and clustering method of SOM. The AANNSOM achieves higher clustering performance in clustering multidimensional datasets when compared to conventional SOM.
3. The development and study of AANN algorithm as dimension reduction method. The study focuses on the dimension reduction ability of this algorithm when dealing with datasets of different sizes, dimensions and clusters. AANN has demonstrated its ability to non linearly reduce the dimension of the datasets, but did not remove inherent characteristics of each dataset allowing them to be classified with high levels of accuracy. This algorithm has also demonstrated its ability to embed test data according to its class.

1.5 Thesis Structure

This thesis is divided into six chapters and is organized as follows. Chapter 1 provides an introduction to the research, aim, objectives and scope of the research, research contributions and also thesis outline. Chapter 2 covers the review of literature on the concepts of multidimensional data, data mining, dimension reduction, data clustering, clustering analysis and processes. Different methods of data clustering from K-means, hierarchical clustering, Principal Component Analysis (PCA) to AANN and SOM are presented in this chapter. The non-linear characteristics of multidimensional datasets used in this research are investigated, presented and discussed as well in Chapter 2. Chapter 3 is dedicated to the investigation of AANN's ability reducing dimensions and clustering of multidimensional data. Chapter 4 introduces combination of AANN and SOM algorithms as hybrid method for dimension reduction and data clustering. Chapter 5

presents a new methodology based on SOM training algorithm for data clustering, classification and visualization. Finally, the last chapter of the thesis (Chapter 6) presents overall conclusions of the thesis and recommendations for further work.
