CHEMICAL CONSTITUENTS AND BIOACTIVITY STUDIES OF *Artocarpus fulvicortex* F. M. JARRET, *Artocarpus integer* var. *silvestris* CORNER AND *Artocarpus rigidus* BLUME

MASURI KAMA BINTI KAMARUDDIN SHAH

A thesis submitted in fulfilment of the
requirements for the award of the degree of
Doctor of Philosophy (Chemistry)

Faculty of Science
Universiti Teknologi Malaysia

MARCH 2019

*This is for you, my supermom Maziah,
for your endless supports and prayers.*

*To my beloved dad Kamaruddin Shah and my brother Firuz Shah
how I wish you could read this. I miss both of you so much*

*To all my sisters that always there for me no matter how emotionally
unstable I am at the time. Thanks for having me!*

*To all my friends that have been waiting for me to officially be “Dr. Surie”
Even though it is sounds impossible initially but finally I am almost there!*

*To whom who is always be the driven force for me to finish this thesis
This is for you*

ACKNOWLEDGEMENT

Praise to our Almighty God for giving endless blessings throughout this academic programme. I would like to express my deepest appreciation to Prof. Dr. Hasnah Mohd. Sirat for her willingness to support of my research and writing, for her constant encouragement, for her valuable sharing of knowledge, positivity and guidance to help me fulfil the requirement in this PhD course. It was a great honour to finish this work under her supervision. A special thanks to my supervisor, Assoc. Prof. Dr. Shajarahtunnur Jamil for her care and supports.

Through sweat and tears, yet by my own desire to complete this research and it has been wonderful as I gain unconditional love and support from many people especially my family and friends. I want to take this opportunity to express deep sense of gratitude to my family and friends for the greatest moral supports along my PhD's journey.

My appreciation also extends to all academic staffs of Department of Chemistry, Faculty of Science and postgraduate students for the helps and contribution to ease this study. Lastly, I would like to thanks to MyBrain15, Ministry of Higher Education for the funding throughout this doctor of philosophy research programme and make my dream come through.

PREFACE

This thesis is the result of my work carried out in the Department of Chemistry, Universiti Teknologi Malaysia between September 2011 and September 2015 under supervision of Prof. Dr. Hasnah Mohd Sirat and Prof. Madya Dr. Shajarahtunnur Jamil. Part of my work described in this thesis have been reported in the following publications.

- 1 Shah, M. K. K., Sirat, H. M., and Jamil, S. (2016). Cholinesterase inhibitors from heartwood of *Artocarpus fulvicortex* F. M. Jarret (Moraceae). *Jurnal Teknologi*. 78(6), 185-189.
- 2 Shah, M. K. K., Sirat, H. M., Jamil, S., and Jalil, J. (2016). Flavonoids from the bark of *Artocarpus integer* var. *silvestris* and their anti-inflammatory properties. *Natural Product Communications*. 11(9), 1275-1278.

ABSTRACT

Investigations on the chemical constituents of *A. fulvicortex*, *A. integer* var. *silvestris* and *A. rigidus* have been carried out. All the extracts were obtained from maceration method by successive extractions using petroleum ether, dichloromethane, ethyl acetate and methanol as solvents. A total of sixteen compounds were successfully isolated; nine from *A. fulvicortex*, five from *A. integer* var. *silvestris* and two from *A. rigidus*. Purification of the extract from heartwood of *A. fulvicortex* led to the isolation of catechin, oxyresveratrol, lupeol-3-acetate and fridelin. 5-Hydroxy-(6:7,3':4')-di(2,2-dimethylpyrano)flavone, carpachromene, norartoarpetin, cycloartocarpesin and fridelin were isolated from the leaves of *A. fulvicortex*. Purification on the barks extract of *A. integer* var. *silvestris* afforded one new pyranoflavone class named as methoxycyclocommunol along with four known flavonoids, heteroflavanone A, artonin F, cudraflavone C and cyclocommunol. Recrystallisation of a fraction from the ethyl acetate barks extract of *A. rigidus* gave artonin E while purification of the dichloromethane extract yielded cyclorigidol. All the pure compounds except cycloartocarpesin and cyclocommunol were tested for their anti-inflammatory properties using radioimmunoassay method on human whole blood. Compounds that inhibited prostaglandin E₂ (PGE₂) production greater than 55% were tested in serial concentration to determine the IC₅₀ values. Cudraflavone C exhibited the strongest inhibition toward vasoactive PGE₂ with IC₅₀ value of 0.03 µg/mL which is higher than positive control, indomethacin that gave IC₅₀ value of 0.06 µg/mL. Catechin and oxyresveratrol showed significant values of inhibition against butyrylcholinesterase enzyme in dose dependent manner. The IC₅₀ values of catechin and oxyresveratrol are 25.0 mM and 3.13 mM, respectively.

ABSTRAK

Penyelidikan mengenai komposisi kimia ke atas *A. fulvicortex*, *A. integer* var. *silvestris* dan *A. rigidus* telah dijalankan. Semua ekstrak diperolehi dengan kaedah rendaman secara berturutan menggunakan petroleum eter, diklorometana, etil asetat dan metanol sebagai pelarut. Sejumlah enam belas sebatian kimia telah berjaya diasingkan iaitu sembilan daripada *A. fulvicortex*, lima daripada *A. integer* var. *silvestris* dan dua daripada *A. rigidus*. Penulenan ekstrak kulit batang *A. fulvicortex* telah memberikan katekin, oksiresveratrol, lupeol-3-asetat dan fridelin. 5-Hidroksi-(6:7,3':4')-di(2,2-dimetilpirano)flavon, karpakromena, norartokarpetin, sikloartokarpesin dan fridelin telah diasingkan daripada ekstrak daun *A. fulvicortex*. Penulenan ke atas ekstrak batang *A. integer* var. *silvestris* telah menghasilkan satu kelas piranoflavon baharu dinamakan sebagai metoksisiklokomunol dan empat flavonoid sedia ada iaitu heteroflavanon A, artonin F, kudraflavon C dan siklokomunol. Penghabluran semula fraksi daripada ekstrak etil asetat batang *A. rigidus* memberikan artonin E manakala penulenan ekstrak diklorometana memberikan siklorigidol. Semua sebatian tulen kecuali sikloartokarpesin dan siklokomunol telah dikaji sifat anti-inflamasi menggunakan kaedah radioimmunocerakinan ke atas darah manusia. Sebatian yang merencatkan penghasilan prostaglandin E₂ (PGE₂) melebihi 55% telah diuji menggunakan kepekatan bersiri untuk menentukan nilai IC₅₀. Kudraflavon C mempamerkan rencatan tertinggi ke atas vasoaktif PGE₂ dengan nilai IC₅₀ 0.03 µg/mL melebihi nilai IC₅₀ 0.06 µg/mL kawalan positif indometasin. Katekin dan oksiresveratrol menunjukkan nilai perencatan yang signifikan terhadap enzim butirilkolinesterase dengan kebergantungan kepada dos. Nilai IC₅₀ katekin dan oksiresveratrol masing-masing ialah 25.0 mM dan 3.13 mM.

CHAPTER 1

INTRODUCTION

1.1 General Information

Medicinal plants are generally known as “Chemical Goldmines” as they contain natural bioactive chemicals that could give benefits to their users by acting as tools for maintaining overall health and vitality [1]. The bioactive chemicals which are acceptable to human and animal systems also work as the secondary metabolites within the plants. Like the human beings, plants are complete organisms that adapted and survived by developing their own natural defences against their enemies [2].

The natural production of the precious bioactive chemicals by medicinal plants creates the intention of many scientists to study it thoroughly. The study of plant is called ethnopharmacology or frequently known as ethno-medicine [3]. Over 250,000 plants species on earth, more than 80,000 are potential to become the herbal medicine. Approximately, 5000 species are extensively used as phytomedicine or the practice of using any parts of the plant and were studied in details [1, 2].

Generally, natural occurring compounds can be divided into three broad categories. First category is related to primary metabolites in which the compounds play important roles in metabolism and cells production. Another two categories are high molecular weight polymeric materials and secondary metabolites. The most attractive part to be discovered is the secondary metabolites because they can be only characterised in limited range of species [4]. Our nature which is extremely complex

and more challenging enhanced the scientists to reveal one by one of the special properties of the secondary metabolites.

Initially, the scientists and doctors began to make a connection between chemistry and diseases by focusing on phytochemical studies of secondary metabolites that may lead to the discovery of new drug candidates. The phytochemicals can be used unmodified as drugs, as precursor for the partial synthesis of drugs or as total synthesis of the new drugs [5]. As the medicinal field developed, many sophisticated and powerful weapons were invented to help people against unpredictable diseases, example the radiotherapy, chemotherapy, steroidal painkillers and antibiotics [2]. More or less the inventions could give bad effects towards the consumers.

As the result, many people prefer traditional alternative and complementary medicines especially herbal medicine, as it is safe for human consumption to boost the immune systems. Nowadays, the research approaches are focusing on the development of herbal medicines as the new pharmaceutical drugs. This creates high demand for novel bioactive compounds from medicinal plants for various purposes [6].

However, even though the utilisation of natural ingredients in product formulations is a popular trend amongst the manufacturers, the terms conventional drugs and herbal medicine usually are misunderstood. Although many of the prescriptions and over-the-counter drugs consumed today are originally come from the plant, conventional drugs are synthetic chemicals which must be approved by the Food and Drug Administration (FDA) for their specific uses and to provide a desired response when it is consumed.

In the other words, these pharmaceutical products are based on the single isolated compound of the plants. Meanwhile, herbal medications are taken from the natural chemicals within a plant either the extract is taken in its original form, combined with other herbal extracts, or in its purified form. This is due to plants comprise of myriad active components which work together to develop the medicinal actions [2].

The phytochemical study of plant generally is the preliminary study to identify the active compounds that may contribute to certain specific properties such as anti-microbial, anti-oxidant, anti-inflammatory, anti-cancer and many more. In this research, *Artocarpus fulvicortex* F. M. Jarret, *A.integer* var. *silvestris* Corner, and *A.rigidus* Blume belong to Moraceae family were chosen as the samples.

1.2 Problem Statements

Besides the appreciable importance as a source of edible fruit, *Artocarpus* species have been reported to have abundance of fascinating and variety of chemical constituents. Some of the metabolites possess remarkable bioactivities that might be considered as the potential medicinal drugs in the future. There is a great opportunity and need to study further on this genus and identify the bioactive compounds from selected three species which are *A. fulvicortex*, *A.integer* var. *silvestris* and *A. rigidus*.

Phytochemical study on first species, *A. fulvicortex* collected from different locality with the previous study was performed on two parts, leaves and heartwood [7]. The second species, *A. integer* var. *silvestris* which was believed to possess interesting secondary metabolites as this species considered as underutilised species and the study on its main variety revealed the isolation of abundance phenolic isolates [8]. Since there are no publication regarding the phytochemicals and bioactivities on *A. rigidus* collected from Malaysia it was chosen to be investigated in this research, since different locality could effects the production of the secondary metabolites.

1.3 Objectives

The objectives of the research are:

1. To extract, isolate and identify the phytochemicals of *A. fulvicortex*, *A.integer* var. *silvestris* and *A. rigidus*.

2. To elucidate the structure of isolated compounds using spectroscopic technique including infrared, nuclear magnetic resonance, ultraviolet spectroscopies and mass spectrometry.
3. To screen and evaluate the ability of the phytochemicals as well as the crude extracts as anti-inflammatory agents and enzyme inhibitors.

1.4 Scope of Study

Studies were carried out to identify the phytochemicals from three *Artocarpus* species and their biological activities. The crude extracts were obtained by cold extraction method. Then, the purification was carried out by successive column chromatography after being fractionated by vacuum liquid chromatographic technique. The bioactivity studies of pure compounds focused on anti-inflammatory activity using several assays in expression of enzyme inhibitory such as cyclooxygenase, lipoxygenase and cholinesterase.

1.5 Significance of Study

The importance of this research is to isolate the bioactive compounds that may lead to the production of new nature-based products. Begins with the isolation and identification of the chemical constituents in the *Artocarpus* species, then chemistry of the compounds can be studied for the evaluation of their bioactivities. This research may reveal the secondary metabolites that might be useful for human being. Those secondary metabolites can also be synthesised chemically or biologically. The bioactive constituents obtained will be used as the basis for product formulation in the agro-based industries. This research can also contribute to the database of secondary metabolites of the plants.
