## Abstract

Text comprehension is the essence of reading. It plays a vital role in learning especially in the acquisition, sharing, and construction of knowledge. Many researchers have highlighted that metacognitive strategies are critically important aspects of skilled reading. Metacognition is basically referred to thinking about thinking. In the field of reading, metacognitive reading strategies are those activities that make readers aware of their thinking as they engage in reading tasks. Since reading is a cognitive enterprise, readers must apply metacognitive knowledge and must invoke conscious and deliberate strategies in order to achieve comprehension of text successfully. In this study, we will present the findings of the research which concentrate on metacognitive reading strategies used by students of Politeknik Kuching Sarawak when reading English texts. From the think aloud analysis, it was revealed that comprehension problems are the result of the students' limited strategy repertoires and poor strategy choice and comprehension monitoring. From the results of the study, we concluded that teaching metacognitive reading strategies should be taken into account in developing students' reading comprehension.

**Keywords:** *Metacognitive reading strategies; reading difficulties; text comprehension.*

## 1. Introduction

Reading can be a challenging activity especially when the text is unfamiliar, technical or complex [1]. It is because comprehension is the reason for reading. Comprehension refers to the ability to process text, to go beyond words and understand its meaning, and to connect between what readers read and what they already know and to give a deep thought of what they have read [2] Readers' ability to comprehend text is largely influenced by their skills and the ability to process text information, and this acquisition of reading takes years to develop. Having said that, reading is indeed a higher order skill which involves learners to apply appropriate reading strategies to cope with reading task demands such as to understand and remember task demands, identify and select reading, monitor comprehension and learning, and synthesize and evaluate a text critically.

Comprehension is not always effortless and fast especially for the struggling L2 readers as Eskey [3] states "reading may be both a means to the end of acquiring the language, as a major source of comprehensible input and end in itself, as the skill that many serious learners most need to employ". In the context of ESL, readers may be capable of reading and understanding each word separately, but their deeper levels of comprehension can be seriously compromised due to failure to link them together to make meaningful ideas. For students to adequately comprehend text, they must possess an awareness of print and that includes decoding skills and metacognitive strategies so that they can monitor their comprehension and reflect on what is read [4]. Metacognitive strategies in reading are particularly important should there be a breakdown at any level of comprehension. Over the years, there has been abun-

dant evidence on reading that emphasizes the role of metacognition as a significant contributor to success in second and foreign language learning. Many researchers have highlighted that metacognitive strategies are critically important aspects of skilled reading. According to McNamara [1] "one source of evidence is that successful readers know when and how to use deliberate strategies to repair comprehension". Metacognition is basically referred to thinking about thinking. In the field of reading, metacognitive reading strategies are those activities that make readers aware of their thinking as they engage in reading tasks [5].

Therefore, the focus of this paper is to provide a detailed description of metacognitive reading strategies used by two students of Politeknik Kuching Sarawak in reading an English text. This description encompassed strategies these readers used while reading English text, reading problems that they encountered and choice of strategies to cope with the problems. Indeed, understanding learners' cognitive processes while reading and what strategies they use is the most important means to help them improve their comprehension and learning from the text.

## 2. Literature Review

Metacognition has been defined in various ways by many researchers over the years [6-12]. For instance, Flavell [9] coined the term "metacognition" as "one's knowledge concerning one's own cognitive processes and products or anything related to them". In his later research, Flavell [10] suggests that metacognition is the monitoring of a wide variety of cognitive enterprise which exists through the interactions of metacognitive knowledge, metacognitive experiences, goals (or tasks), and action or strategies. Other researchers such as Brown [8] defines metacognition as

knowledge and control of the cognition domain. As for Livingston [13], metacognition is a higher order thinking that comprises learners' active control over their cognitive processes engaged in successful learning.

Metacognition can be divided into three important components namely metacognitive knowledge, metacognitive regulation, and metacognitive experiences. Metacognitive knowledge is what individuals know about themselves and others. Metacognitive knowledge can sometimes be called metacognitive awareness. Metacognitive regulation is referred to metacognitive activities that aid learners to take control of their learning [14]. Metacognitive experiences are related to experiences that have to do with cognitive endeavors and these experiences include one's feelings, estimates or judgement related to the features of learning task, the cognitive processing and its outcome [15].

Research on reading comprehension has shown the importance of metacognitive reading strategies in facilitating comprehension. Reading is viewed as an active activity whereby readers are active processors of information who constantly seek out information to remediate problems and use their prior knowledge to achieve learning, through the use of learning strategies. Metacognitive reading strategies have become one of the effective ways to foster students reading comprehension. Readers who are metacognitively aware are called proficient readers because they use more than one metacognitive strategy to aid comprehension. As explained by Anderson [16], "strong metacognitive skills empower language learners: when learners reflect upon their learning, they become better prepared to make conscious decisions about what they can do to improve their learning". In contrast, learners without metacognitive approaches are essentially learning without direction to plan their learning, monitor their progress and evaluate their accomplishment [17].

### 3. Methodology

The study described here was carried out at Politeknik Kuching Sarawak (PKS), Kuching, Sarawak, where a large number of local students who finished their secondary school came to study.

#### 3.1. Subject

There were two participants involved in the present study. Alice and Hanis (not their real names for privacy reasons) had volunteered to participate in a think-aloud protocols at the said institution. They are both of semester 4 students who enrolled in Malaysian English University Test tuition class for March 2018 session. These participants come from two different fields of study – commerce and petrochemical engineering. Table 1 below is a description of participants' profile.

Table 1: Participants' profile

Name	Language at home	Department	Semester	Race	Age	Gender
Alice	English or Malay	Commerce	4	Melanau	20	Female
Hanis	Malay	Petrochemical	4	Bajau	20	Male

#### 3.2. Instrument

In order to assess students' metacognitive reading strategies, participants were given one expository English text entitled "The internet can end global inequality. Here's how" by Parekh [18] which consists of 776 words. The text was taken from World Economic Forum (online). The reading level of this text (as measured

by Flesch Kincaid Reading Ease) was at 43.8 which should be sufficiently difficult to require strategic behavior by the chosen participants.

#### 3.3. Procedure

The data were collected by the researcher. Each subject participated in a 1.5-hour session and met individually with the researcher. To acquaint the students with think-aloud process, the session began with a short orientation to the technique of thinking aloud. The students were given a sample text for training purpose. The researcher demonstrated the think-aloud task by reading aloud the first paragraph and at the same time, the researcher speaks aloud the thoughts in her head as she engaged in reading. The student then was told that he/she was going to do the same task similar to the demonstration given and he/she was to report to the researcher each of his/her thoughts as they occurred. The student was given a reminder that the objective of the think-aloud activity is to examine their strategies used in reading comprehension. This task took about 30 to 40 minutes depending on how well the students get used to the think-aloud process. This task was not scored because the objective was to familiarize the students with the think-aloud task.

The actual think-aloud was took place immediately after the training. The students were given a text entitled "The internet can end global inequality. Here's how". The students were asked to read aloud each sentence at a time and articulate what he/she was doing or thinking while reading especially the strategies they used to help them understand the passage. All responses and prompts by both the researcher and the students were taped recorded and written verbatim. The think-aloud protocols were analyzed based on reading strategies classification proposed by Mushait [19] (See Table 2). Strategy count is purely based on types of strategies which appeared during think-aloud process. Based on the Table 2 below, RS referred to reading strategies. Mushait has listed 41 reading strategies which 21 strategies are text-related strategies, 16 strategies are word-related strategies, and four metacognitive strategies.

Table 2: Reading Strategies Classification by Mushait (2003)

Text-related strategies		Word-related strategies		Metacognitive strategies
Top-down strategies	Bottom-up strategies	Top-down strategies	Bottom-up strategies	
RS1: Paraphrasing	RS16: Skimming	RS22: Keeping reading after encountering a problem (e.g. unknown word) with intention of using later text to draw inferences from it	RS26: Referring to difficulty with an unknown word	RS38: Planning what strategy to use or what to do while reading.
RS2: Predicting/hypothesizing about meaning	RS17: adjusting the size of the chunk read at one time such as phrases, words,	RS23: Relating to knowledge of the L1 at the word level	RS27: Re-accessing the lexicon to try to find/recall the	RS39: Monitoring the strategy choice

	sentences, and paragraphs		meaning of a word he thought to be known	
RS3: Correcting previous error / revising previous misunderstanding	RS18: Rereading	RS24: Relating to knowledge of the L2	RS28: Skipping	RS40: Monitoring or evaluating successful comprehension
RS4: Keeping the meaning in mind (connect comprehension across text)	RS19: Translating	RS25: Guessing using immediate context	RS29: Using synonyms in context	RS41: commenting on strategy used
RS5: Relate to previous knowledge of content. This could be either general or subject specific	RS20: Questioning 3 (showing lack of comprehension)		RS30: Using opposites in context	
RS6: Relating to personal experience	RS21: Focusing in grammar		RS31: Referring to dictionary	
RS7: Relating to cultural knowledge			RS32: Appealing to researcher	
RS8: Relating knowledge of formal schemata (making use of text structure)			RS33: Marking the text	
RS9: Looking for the main ideas			RS34: Guessing by using morphology / grammar	
RS10: Summarizing			RS35: Guessing by using a similar sounding L2	
RS11: Questioning 1 (expressing lack of sufficient information in the text being read)			RS36: Rereading the unknown word	
RS12: Questioning 2 (showing disagreement)			RS37: Focusing on certain words	
RS13: Inference				
RS14: Expressing an opinion or agreement				
RS15: Confirming or revising previous prediction				

## 4. Results and Findings

The following is a list of reading strategies used by the students and reading problems that they encounter when reading an English text. In order to give a clearer picture of each strategy used, the researcher will provide each strategy with its definition, a sentence of the original text being used in the think aloud (if necessary), and examples extracted from participants' protocols which to indicate strategy use. Comments were also given if needed. As such, the asterisk symbol \* will be used to indicate comment on the particular reading strategy.

Participants in the study are allowed to use their mother tongue while thinking aloud to encourage articulation of thoughts. Therefore, their protocols were translated into English. Each translated word will have the square brackets symbols [ ]. However, if the participants used translation as part of the strategy, their protocols will be maintained in their mother tongue and a full translation of the protocols will be made. As such, all of the protocols are in italic and underlined. Angle brackets < > were used to indicate participants' actions.

### 4.1 Types of Strategies Used By Alice

Alice thought aloud in both English and Malay this is evidenced by the use of both English and Malay language interchangeably while thinking-aloud. She reported using ten strategy types in the think-aloud process and some of the strategies were repeated throughout the think-aloud process. She approached the text in an active way and it was observed that she used text-related strategy (higher-level processing) such as questioning, summarizing, expressing opinion or agreement, and keeping the meaning in mind to comprehend the text better. She also used rereading strategy to help in fostering her comprehension.

Below is the example of Alice's protocols. In her protocols, it was found that Alice frequently used RS20: Questioning 3. There are three types of questioning strategies which Mushait [19] differentiates them into three different categories: questioning 1 (showing lack of sufficient information in the text being read), questioning 2 (showing disagreement), and questioning 3 (showing lack of comprehension). Whenever a reader questions the text by means of showing lack of comprehension, this should indicate that the reader is using RS20: Questioning 3 strategy. According to Mushait (2003), the reader can questioning text either in the form of text or a statement. However, if the answer to the reader's question could be found in the text, it shows lack of understanding, not expressing lack of sufficient information in the text being used [19].

Reading strategies	Original texts	Student's protocols
RS20: Questioning 3 (Showing lack of comprehension)	At every level, our global narrative is increasingly colored by self-interest. More and more states are seeking to withdraw from international agreements, for example.	<i>'This is the example for the, global narrative is increasingly colored by self-interest.. is it? Yang ini [this one], More and more states are seeking...'</i>
	One recent example is the Government of India's <u>Aadhaar online identity verification system</u> , which,	<i>'I don't really understand this sentence either. Teething problems?'</i>

	<p>globally. Men still outnumber women as web users in every part of the world - this must change, too. And it can, if there is a concerted effort on the part of global corporations, governments, civil society and investors to bring online the forgotten half of our world.</p>	<p>net. Jadi, mereka lebih advance-lah sebab mereka sudah ada internet. [Therefore, they are more advance because they have internet.] Perenggan di bawah ini bercerita berkenaan [The paragraph below talks about] 52% world's population masih tidak kenal internet [is still foreign to the internet.] Jadi, kita mesti wujudkan peluang untuk mereka-lah supaya mereka dpat guna itu internet, supaya mereka lebih up-to-date and advanced dalam apa yang mereka buat. [Therefore, we must create opportunities for them to use internet so that they are more up-to-date and advanced in what they do.]</p>
	<p>A significant first step would be to categorize the internet as infrastructure as basic as roads, sewage, water and electric systems.</p>	<p>'What it means here I think is just like what I have said earlier. Those who never use internet should be given opportunity to use internet because the internet is equal to basic necessities such as such as roads, sewage, water, and electricity. So, they have to be given the opportunity so that they too can progress.'</p>

Apart from using cognitive reading strategies, Alice was found using metacognitive reading strategies as well. It can be seen in the protocols given below, she used RS40 (monitoring or evaluating successful comprehension) and RS41 (commenting on strategy used) which indicate that Alice did employ metacognitive reading strategies while reading. Based on her protocols below, Alice was aware of her comprehension problem and she monitored her comprehension.

Reading strategies	Original texts	Student's protocols
<p>RS 40: Monitoring or evaluating successful comprehension</p>	<p>This gradual erosion of our shared obligation to progress more equitably is creating a deeply divided world.</p>	<p>'But I still don't understand the word 'erosion'.</p> <p>* In the beginning, Alice identified 'erosion' as a problematic word. She carried on reading without paying attention to the problem. After reading the next few lines, she diverted her attention to the word 'erosion'. This indicates that Alice is aware of her understanding.</p>
	<p>The big hurdle now is scaling up these success stories.</p>	<p>'Oh, I think that the sentence is like err, not complete. It's like I need to read further to get general idea.'</p>
<p>RS41: Commenting on strategy used</p>	<p>A significant first step would be to categorize the internet as infrastructure as basic as roads, sewage,</p>	<p>'Setelah saya baca lagi sekali baru-lah saya faham kerana phrasa ini [But after I read back then I understand be-</p>

	<p>water and electric systems.</p>	<p><u>cause there is a phrase</u> 'categorize the internet as basic roads, sewage, water and electric'. Haha! The internet should be as important as these basic necessities'. Itu maksud dia [That is the meaning].</p>
--	------------------------------------	--

Using a reference such as a dictionary is not a frequent strategy that Alice employed throughout the think-aloud session. As mentioned earlier, she did not focus on word meaning processing as unknown words was not interrupting her overall understanding. She appeared to be able to process the meaning of what was read without the need to translate the unknown words into L1 at the word level. The only time that she was observed of using external source e.g. dictionary was when she thought that the particular unknown words e.g. 'erosion' and 'social cohesion' were important for her understanding.

Reading strategies	Original texts	Student's protocols
<p>RS31: Referring to dictionary</p>	<p>...he predicted a world so unified by an electronic nervous system that the human experience of living anywhere in the world would be one of deep connectedness and social cohesion – much like life in small villages.</p>	<p>'If social cohesion, err, let me check in the dictionary.'</p>
	<p>This gradual erosion of our shared obligation to progress more equitably is creating a deeply divided world.</p>	<p>'But I still don't understand the word 'erosion'. &lt;She referred to dictionary&gt; Should I read the meaning to you?'</p>

She demonstrated her good dictionary skill when there were two suggested meaning found in the dictionary. She was able to relate the correct definition to the context. For instance,

*'Alright. From this dictionary, erosion is the process by which the surface of rock or land is gradually damaged by water, wind, etc. or I think, <look back at the second meaning in the dictionary> the gradual reduction or destruction of something important. Ah! This is more related!'*

Other frequent strategies used by Alice were rereading and guessing using immediate context. Rereading strategy is often used by the reader to read back a small or large portion of text more than once to facilitate comprehension [19]. Meanwhile, guessing using immediate context is a strategy that readers use to guess the meaning of the unknown word. This strategy requires local clues to guess meaning of the unknown word.

Reading strategies	Original texts	Student's protocols
<p>RS 18: Rereading</p>		<p>'Yeah, I read back this part right here.'</p> <p>'I'm reading back'.</p> <p>*This strategy was repeatedly used throughout the think-aloud process.</p>
	<p>RS25: Guessing using immediate</p>	<p>The biggest advantage of this digital</p>

context	unification will come when we all learn to create and produce using technology, rather than merely consume it.	<i>sentence. But I think it could mean to unite people?’</i>
	If we can bring this ‘superpower’ to everybody across the global, economic, social, professional, gender and age divides, then I believe it has the potential to become the great equalizer of our humanity and the amplifier of our potential.	<i>‘Superpower bermaksud pengetahuan yang berkaitan dengan teknologi sebab [means knowledge that relates to technology because] it relates to the word code just now.’</i>
	One recent example is the Government of India’s Aadhaar online identity verification system, which, despite some early teething troubles, today rivals Facebook in its usage by Indians.	<i>Erm, I think Aadhaar online identity verification system is a system, err, or an app just like Facebook because in the text it says its rival is Facebook. So I think that they are quite similar.’</i>

Last but not least, it was reported that Alice did use a strategy called expressing an opinion or agreement. This strategy focuses on a reader expresses his or her opinion to elaborate what has been read, i.e. the content. The intention is to show agreement with the idea presented by the writer. As shown in her protocol below, the author did not mention arguments involved in the last paragraph nor did the author mention in the previous paragraph. However, Alice gives a deep thought about it and relates it with the term ‘social cohesion’. This indicates her opinion expression.

Reading strategies	Original texts	Student’s protocols
RS14: Expressing an opinion or agreement	...he predicted a world so unified by an electronic nervous system that the human experience of living anywhere in the world would be one of deep connectedness and social cohesion – much like life in small villages.	<p><i>‘So social cohesion ini mungkin bermaksud [could mean] all of us secara [by] social cohesion &lt;looked at the dictionary to reread the meaning&gt; err, mungkin maksudnya semua individu [may be it means that individuals] are united and in good relationships, no arguments. I think so.’</i></p> <p>Prompt: may I know how do you know that there are no arguments? Does it stated in the text?</p> <p><i>‘No. but I suddenly thought about it and relate it to the text.’</i></p>

**4.2 Reading Problems Faced By Alice**

Alice’s comprehension began to falter when she was no longer able to maintain her attention during text processing. She was experiencing attention-allocation deficits as mentioned by Kendeou, Broek, Helder & Karlsson [21] in which it was due to

detail distraction especially when reading longer texts. Therefore, she failed to focus on the main ideas. Some of the evidence about her attention-allocation deficits are reflected on the part where she could not guess what Aadhaar is although clue is presented in the text; she pointed out that the concept of global village introduced by McLuhan is there will be no arguments and human can live in the North Pole by changing the setting. These indicate in less coherent mental representations of text and this could also indicate that she does not monitor or evaluate her comprehension.

Original texts	Student’s protocols
One recent example is the Government of India’s Aadhaar online identity verification system, which, despite some early teething troubles, today rivals Facebook in its usage by Indians. Scaled to include over one billion people, Aadhaar allows governments, businesses, startups and developers to use a brand new digital infrastructure to solve some of the country’s hardest problems through paperless, cashless, and even presence-less service delivery.	<p><i>‘After reading, I’m a bit confused. And perhaps Aadhaar is like an online shopping app because of this phrase &lt;point at the paper&gt; ‘paperless, cashless and presence-less service delivery’. Now I think maybe Aadhaar is an online shop? Is it?’</i></p>
...he predicted a world so unified by an electronic nervous system that the human experience of living anywhere in the world would be one of deep connectedness and social cohesion – much like life in small villages.	<p><i>‘So social cohesion ini mungkin bermaksud all of us secara social cohesion &lt;looked at the dictionary to reread the meaning&gt; err, mungkin maksudnya semua individu are united and in good relationships, no arguments. I think so.’</i></p> <p>Prompt: may I know how do you know that there are no arguments? Does it stated in the text?</p> <p><i>‘No. but I suddenly thought about it and relate it to the text.’</i></p>

Despite all this, the researcher could not claim that Alice is a strategic reader. It is because a strategic reading requires reading beyond the printed text, to manipulates background knowledge and schemata in order to extrapolate for deeper comprehension [19] in which she did not display it during think-aloud.

**4.3 Types of Strategies Used By Hanis**

Hanis spoke aloud mostly in L1. From the protocols, it was found that Hanis used eight types of strategies in which he frequently used translating strategy as a way to facilitate his understanding. Hanis can be categorized as a shallow reader. According to McNamara [1], shallow readers believe that their comprehension are adequate if they can recognize content words and can understand most of sentences. Throughout the think-aloud process, Hanis settled for shallow level of analysis to aid comprehension which is relying so much on translating strategy while trying to comprehend English text. Below are some of the examples of his protocols which indicate translating English in L1.

Reading strategies	Original texts	Student’s protocols
RS19: Translating	At every level, our global narrative is increasingly colored by self-interest.	<i>‘Setiap paras narrative...’ / ‘Every level narrative...’</i>
	More and more states are seeking to withdraw from international agreements, for example.	<i>‘Maksudnya di sini lebih banyak negara-negara yang mencari untuk keluar daripada persetujuan international sebagai</i>

		<i>contoh. ' [It means that more countries are seeking to withdraw from international agreement, for example]</i>
Businesses are investing in new technology to move forward and drive growth, but are not always as enthusiastic when it comes to bringing their people along for the ride.		<i>'Bisnis membuat pelaburan ke atas teknologi baru dan mereka ini ingin bergerak ke hadapan tetapi saya rasa drive growth ini seperti perkembangan rasanya ia bermaksud mempertingkatkan perkembangan tetapi tidak se-enthusiastic kalau perkara yang membuat kita rasa semangat. Tetapi di ayat ini mereka ini tidak berasa semangat atau tidak berminat untuk membawa orang lain. ' [Business is investing on the new technology and they want to move forward but I think drive growth is like development. I think it means to further reinforce development but not enthusiastic means things that make us feel enthusiastic but in this sentence it says they are not feeling enthusiastic to bring other people for the ride.]</i>
This gradual erosion of our shared obligation to progress more equitably is creating a deeply divided world.		<i>'Erm, gradual erosion erm, because erosion ini adalah hakisan. Gradual erosion adalah hakisan yang sekata? Hakisan yang sekata dalam membina sesuatu?' [Erm, gradual erosion erm, because erosion is the process of eroding. Gradual erosion means uniform erosion? A uniform erosion of building something.]</i>

Furthermore, Hanis also reported using questioning 3 reading strategy (showing lack of comprehension) in his protocols. Below are some of his protocols to indicate such strategy.

Reading strategies	Original texts	Student's protocols
RS20: Questioning 3 (showing lack of comprehension)	And as individuals, we often chase our dreams without giving enough thought to building more sustainable and inclusive economies and societies as we do so.	<i>'Adakah ia bermaksud untuk membina lebih banyak ekonomi dan society? Erm, saya tidak fahamlah maksud sustainable and inclusive ini. ' [Does it mean to create more economy and society? Erm, I don't understand the meaning of 'sustainable and inclusive.]</i>
	After all, the role of technology in increasing general inequality has been the subject of heated discussions in recent times.	<i>'I think general inequalities berkaitan dengan yang di atas ini. ' [links with the one on top (previous paragraph)] Tapi saya tidak tahu macam mana. [Is just that I don't know how].</i>
	The biggest advantage of this digital unification will come when we all learn to create	<i>'I do understand the writer cakap pasal manfaat terbesar digital unification tetapi err, saya tidak faham maksud unification [talks</i>

	and produce using technology, rather than merely consume it. I	<i>about the greatest benefit in digital unification but I don't understand the meaning of unification].</i>
--	--	--

Other common reading strategies used by L2 readers to comprehend English text are keeping in mind (connect comprehension across text), rereading, guessing using immediate context, and referring to dictionary. These strategies were employed by Hanis when reading an English text and some has been used repeatedly while thinking aloud.

Reading strategies	Original texts	Student's protocols
RS4: keeping in mind (connect comprehension across text)	After all, the role of technology in increasing general inequality has been the subject of heated discussions in recent times.	<i>I think general inequalities berkaitan dengan yang di atas ini ' [links with the one on top (previous paragraph)]</i>
RS18: Rereading		<i>'Saya baca semula sebab saya tidak faham sebab ayat ini terlalu panjang' [I read back because I don't understand because the sentence is too long].  'Err, kejap, saya baca balik' [Wait, I read back].  'Wait a minute; let me read again the next sentence.'</i>
RS25: Guessing using immediate context	Like the Sub-Saharan farmers who are now able to manage risks and significantly increase their yield because they can access reliable and timely weather forecasts, for example, or Latin America's hitherto unbanked population that can now prove their creditworthiness using data gathered from their use of telecom services.	<i>'Saya tidak tahu maksud hitherto ini. Mungkin dia bermaksud puak etnik di latin America. ' [I don't understand what hitherto is. Perhaps it is an ethnic group of Latin America].</i>
RS31: Referring to dictionary	The biggest advantage of this digital unification will come when we all learn to create and produce using technology, rather than merely consume it.	<i>I do understand the writer cakap pasal manfaat terbesar digital unification tetapi err, saya tidak faham maksud unification [talks about the greatest benefit in digital unification but I don't understand the meaning of unification]. Mungkin saya patut mencari maksudnya di dalam kamus' [Perhaps I should refer to dictionary.]  * Although her inferencing is wrong, he attempted to guess the meaning of an unknown word. This indicates a strategy used by the reader.</i>

Hanis was also reported to use personal experience in relating with what he read. Below are some of protocols which reflect on Hanis strategy employment.

Reading strategies	Original texts	Student's protocols
RS6: Relating to personal experience	But it doesn't have to be like this: we can create shared prosperity through a wholehearted embrace of digital technology.	<i>'Dalam ayat ini, erm, [In this sentence] I think prosperity means something joyful, seperti [similar to] prosperity burger dalam iklan McD's [in McD's advertisement]. So, I guess penulis ini bercakap tentang err, penulis ini mungkin bercakap pasal sesuatu yang saya tidak faham' [this author is talking about err, the author may have talked about something which I don't understand.]</i>
	But then, problems worth solving rarely are - and yet they must be tackled.	<i>'Tackled di sini bermaksud, err, saya bermain bola kan dan perkataan tackle selalu kami guna. Dia [tackle] bermaksud err, saya tidak tahu macam mana mahu cakap, err, untuk membuang, seperti membuang object yang berada di depan kamu. So, di dalam ayat ini, dia bercakap berkenaan masalah yang harus dibuang.' Tackled here means, err, I play football and tackle often one of the word we used to say in the football term. It means err, I don't know how to say, err, to remove, it's like to remove the object in front of you. So, in this sentence, it says that problems must be removed.'</i>
	Digitization can deliver that much-needed sense of oneness for our fractured world. It's up to us to embrace it.	<i>'Digitization reminds me of one of telecom service which is Digi.'</i>
	...he predicted a world so unified by an electronic nervous system that the human experience of living anywhere in the world would be one of deep connectedness and social cohesion - much like life in small villages.	<i>'Electronic nervous system adalah seperti badan manusia macam tu, ada sistem' [is like a human body, there is a system]. So, the electronic nervous system ada kaitan dengan komputer [has to do with the computer].</i>

Last but not least, Hanis was reported guessing the meaning of an unknown word using morphology / grammar. Below is the protocol which indicates of such strategy being used by Hanis. In his protocols, Hanis was making use of word root to guess the meaning of an unknown word. At the beginning, Hanis tried to refer the meaning of the word unification in the dictionary. However, the word is not listed in the dictionary. Therefore, Hanis guessed the meaning of the word using morphology / grammar strategy.

Reading strategies	Original texts	Student's protocols
RS34: Guessing by using morphology / grammar	The biggest advantage of this digital unification will come when we all learn to create and produce using technology,	<i>'Saya rasa unification ini datang daripada perkataan unifi' [I think unification comes from the word unifi].</i>

	rather than merely consume it.	
--	--------------------------------	--

#### 4.4 Reading Problems Faced By Hanis

Based on the data, it was reported that Hanis' greatest obstacle in comprehending an English text is due to unfamiliar words. He reported to have difficulties in understanding words such as sustainable, inclusive, unification, and hitherto. Since translation is his most popular strategy choice, his direct translation strategy did not aid him to have a better understanding. For instance, he translated gradual erosion as uniform erosion, which leads him to be more confused. Other than this, Hanis self-reported to have a problem in reading longer sentence where he has to reread in order to understand the text better.

#### 4.5 What Do They Have in Common?

Firstly, the role of vocabulary in assisting reading comprehension in both L1 and L2 is important (22). Based on their think-aloud protocols, the participants reported to encounter unknown word as their comprehension obstacle. Due to this reason the participants were not able to construct a visual representation of a word if the meaning is unknown. This indicates that vocabulary is the key factor affecting their comprehension which needs to be addressed.

Secondly, the researcher could not claim that they were demonstrating a high metacognitive awareness in reading an English text although both participants were able to understand the reading text to a certain degree. This is because they reported to use eighteen strategies which mostly are text-related and word-related strategies. Occasionally, Alice was reported using metacognitive strategies but it was not enough to claim that she is a good reader as some of her comprehensions were misleading. On the other hand, Hanis did not reflect what good readers do. Hanis does not seem to have a purpose in reading. He lacked of the metacognitive strategies to facilitate deeper levels of comprehension such as inferences, linking ideas coherently, scrutinizing the validity of claim with a critical stance, and recognizing author's motives. Most of the think-aloud data showed that Hanis concentrated more on translating sentences into L1. He did not report of reading the title of the text nor did he skimming the text before engage in reading. Other than that, Hanis did not thinking about his progress in learning as he was eager to complete the task without reflecting on it. However, to say that Hanis do not employ metacognitive strategies at all in his reading would seem to be unfair. Although Hanis did not report using metacognitive strategies in the think-aloud, it might have been used automatically without him consciously aware.

### 5. Conclusion

To conclude, a strategic reader or skilled reader will always demonstrate the following actions: 1) planning what strategy to use while reading, 2) monitoring his/her strategy choice, and 3) monitoring or evaluating her comprehension. Based on the findings, it shows that the participants are having limited strategies repertoires to help them in understanding the text better. A possible reason for the lacking of metacognitive strategies in reading is that students do not have adequate metacognitive awareness. In response to this concern, teaching metacognitive reading strategies should be taken into account in developing students' reading comprehension. In other word, language teachers should teach their students metacognitive strategies explicitly as part of their reading instruction so that their comprehension skills can be developed.

## Acknowledgement

We would like to express our thanks to Marcus Kho for his assistance in collecting the data for this study.
