

# HEAVY METAL CONTAMINATION IN SEDIMENTS AND SURFACE WATER

SYAHRUL NAZRIN BIN ABDUL RAHMAN

A project report submitted in partial fulfilment of the  
requirements for the award of the degree of  
Master of Engineering (Geotechnics)

School of Civil Engineering  
Faculty of Engineering  
Universiti Teknologi Malaysia

JANUARY 2020

## **DEDICATION**

This thesis is dedicated to my wife, who sacrificed the most during my absence for the completion of my Master of Engineering (Geotechnics). Thanks for the support and words of encouragement during my post graduate study.

## **ACKNOWLEDGEMENT**

This thesis would not possible without the assist from many people around me. Special thanks to my supervisor, Dr Nor Zurairahetty Mohd Yunus for your patient, guidance, and knowledge shared towards my understanding to engineering. Moreover, I am very thankful to my friends around me, Muhammad Zakwan Bin Zulkifli, Nalinii Ravichandran and my classmates who always help me when needed. I am also feeling indebted to Universiti Teknologi Malaysia (UTM) and all its staffs for being very supportive since my Bachelor Degree until now. Finally, I would like to express my gratitude and appreciation to all persons who directly or indirectly assist, facilitate and encourage me until the completion of this project.

## ABSTRACT

This study was conducted to determine the level of heavy metal concentration in sediment and surface water in the Ringlet Lakes, Cameron Highlands and the results obtained were compared with the Dutch Soil Remediation Intervention Value, 2000 (the New Dutch List) and National Water Quality Standards for Malaysia, Class IIB (Recreational use with body contact) for sediment samples and surface water samples respectively. Total of 9 sampling stations were established, 2 samples (April 2018 and July 2018) for each stations for sediments samples and 5 samples (May 2018, June 2018, July 2018, August 2018 and September 2018) for each stations for surface water samples. The parameters that were determined for sediment samples consist of Arsenic (As), Cadmium (Cd), Chromium (Cr), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) and Zinc (Zn). Whereas the parameters for surface water samples consist of includes Arsenic (As), Cadmium (Cd), Chromium Hexavalent ( $\text{Cr}^{6+}$ ), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) and Zinc (Zn). Results for sediments samples shown that all heavy metals concentration did not exceed the Dutch Soil Remediation Intervention Value, 2000 (the New Dutch List). However, Copper (Cu) and Mercury (Hg) exceeded the National Water Quality Standards for Malaysia, Class IIB (Recreational use with body contact). No Cadmium (Cd) was found in all sediment samples and the present of Cadmium (Cd) and Chromium Hexavalent ( $\text{Cr}^{6+}$ ) in surface water samples are non-detectable. Ringlet Lakes considered to be contaminated due to the concentration of Copper (Cu) and Mercury (Hg) in surface water exceeded the recommended value for most samples. It is recommended that periodic monitoring to be conducted and to determine the sources of the contamination to avoid further contamination in the area.

## ABSTRAK

Kajian ini dilakukan untuk mengkaji tahap kepekatan pencemaran logam berat pada sedimen dan air di Tasik Ringlet, Cameron Highlands dan keputusan yang diperoleh dibandingkan dengan Dutch Soil Remediation Intervention Value, 2000 (the New Dutch List) untuk sampel sedimen dan Standard Kualiti Air Kebangsaan, Kelas IIB (kegunaan rekreasi) untuk sampel air. Terdapat 9 stesen sampel, 2 sampel bagi setiap stesen untuk sediment (April 2018 dan Julai 2018) dan 5 sampel bagi setiap sampel bagi air (Mei 2018, Jun 2018, Julai 2018, Ogos 2018 dan September 2018). Parameter yang dikaji bagi sampel sediment adalah Arsenic (As), Cadmium (Cd), Chromium (Cr), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) dan Zinc (Zn). Parameter untuk sampel sedimen pula adalah Arsenic (As), Cadmium (Cd), Chromium Hexavalent ( $\text{Cr}^{6+}$ ), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) dan Zinc (Zn). Keputusan kepekatan logam berat pada sampel sedimen menunjukkan bahawa tiada kepekatan logam berat yang melepasi Dutch Soil Remediation Intervention Value, 2000 (the New Dutch List). Walaubagaimanapun, Copper (Cu) dan Mercury (Hg) melepasi had Standard Kualiti Air Kebangsaan, Kelas IIB (kegunaan rekreasi). Tiada Cadmium (Cd) yang dijumpai di dalam semua sampel sedimen. Cadmium (Cd) dan Chromium Hexavalent ( $\text{Cr}^{6+}$ ) tidak dapat dikesan pada semua sampel air. Tasik Ringlet boleh dikategorikan sebagai tercemar kerana kepekatan Copper (Cu) dan Mercury (Hg) lebih daripada had yang disarankan. Adalah digalakkan untuk melakukan pantauan yang berkala untuk kepekatan logam berat di Tasik Ringlet dan mencari sumber pencemaran bagi mengelakkan pencemaran yang lebih teruk.

# CHAPTER 1

## INTRODUCTION

### 1.1 Introduction

Malaysia currently undergoing rapid economic growth which leads to various development throughout the nation mainly on industrial and agricultural developments. The rapid developments are directly and indirectly affecting our environment such as the water quality, soil, groundwater, flora and fauna, ambient air, noise and many more. Government of Malaysia leads by the Department of Environment have issued a guideline in which to control pollution for every development. An Environmental Impact Assessment Guideline is one of the guideline published by the Department of Environment Malaysia as one of the control measure to minimise pollution and to monitor the pollutant released to the environment in accordance to the Environmental Quality Act (EQA) 1974.

There are many contaminants that can enter the environment specifically on water pollution and soil pollution. For examples for soil, it can be contaminated due to several activities such as industrial, mining, disposal of high metal wastes, sewage, pesticides, irrigation, coal combustion, spillage of chemicals, and others. Most heavy metals found in contaminated areas are lead (Pb), chromium (Cr), arsenic (As), zinc (Zn) cadmium (Cd), copper (Cu), mercury (Hg) and nickel (Ni) (R. A. Wuana, 2011).

There are many potential risk and hazard caused by heavy metal contamination. Human can be directly consumed heavy metals by eating contaminated food, contaminated water, contaminated animals, inhaling polluted air, and others (G. A. Engwa *et al.*, 2019). Heavy metals may cause serious health effects to human if consumed higher than the recommended value. For example, consuming high level of cadmium (Cd) may decreased learning ability, demonstrate decreased in attention level

and memory, damage nerve function, exposure to breast cancer, prostate cancer, pancreatic cancer, lung cancer and others.

## 1.2 Problem Background

The proposed area of study is Ringlet Lakes, Cameron Highlands, Pahang. Based on Figure 1.1, Ringlet Lakes located at 15km from Tanah Rata, Cameron Highlands.

Figure 1.1 Ringlet Lakes

There are several rivers surrounding the Ringlet which directly effecting the surface water quality and sediment quality in Ringlet Lakes which are Bertam river, Kilat

river, Khazanah river and Jasin/Jasik river. Ringlet lakes is one of reservoir that was handled by Tenaga Nasional Berhad for electricity generation under Cameron Highlands Hydroelectric Power Stations.

### **1.3 Problem Statement**

Most of the contamination and pollution will concentrated at the Ringlet Lakes as it is surrounded by several rivers. Activities near the streams and rivers have the potential to cause soil and water pollution resulted from surface runoff and soil erosion. High quantities of sediment which mostly carry micronutrients and contaminants such as suspended solid, oil and grease, ammoniacal nitrogen, phenol, heavy metals, Aldrin, Dieldrin, Endosulfan, Endrin and E Coli will be transferred to the lakes especially during raining events. Pollution due to erosion and sedimentation can cause physical, chemical and biological impacts to water.

Rapid development and uncontrolled clearing of land for housing, hotels, road construction, agricultures in the area have resulted in serious degradation of land, severe silt accumulation, contamination and other. Activities such as agricultures may cause serious pollution because the usage of pesticides, fertilizers and soil erosion by surface runoff. Other activities like construction, roads and commercial area contribute to vehicles fumes, oil and grease, sewage, disposal of wastes and other. Hence, it is important to carry out monitoring to monitor the level of contaminant entered the water body.

## **1.4 Research Goal**

### **1.4.1 Research Objectives**

To monitor the level of contaminants in the project area, this research aims to document the concentration of heavy metals at Ringlet Lakes Cameron Highlands, Pahang. The key objectives of this research are :-

- (a) To determine the level of heavy metal concentration in sediment and surface water in the Ringlet Lakes, Cameron Highlands.
- (b) To carry out comparison between the heavy metal concentration results with the Dutch Soil Remediation Intervention Value, 2000 (the New Dutch List) and National Water Quality Standards for Malaysia, Class IIB (Recreational use with body contact) for sediment samples and surface water samples respectively.

## **1.5 Scope of Study**

Two (2) type of sampling will be conducted to determine the heavy metals concentration which are sediment sampling and surface water sampling. The sampling station for both sediment samples and surface water samples will be same. However, the frequency of sampling for sediment are lower than surface water due generally, the rate of sedimentation is much lower than surface water runoff.

There are nine (9) sampling stations for sediments samples which are R1, R2, R3, R4, R5, R6, R7, R8 and R9. Sediment samples were taken two (2) times which was in April 2018 and July 2018. The list of parameters for sediment sampling includes Arsenic (As), Cadmium (Cd), Chromium (Cr), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) and Zinc (Zn). Results obtained are compared with the Dutch Soil

Remediation Intervention Value, 2000 (the New Dutch List) for soil and sediment which indicate the acceptable levels of heavy metals in sediments.

There are nine (9) sampling stations for surface samples which are R1 R2, R3, R4, R5, R6, R7, R8 and R9. Sediment samples were taken five (5) times which was in May 2018, June 2018, July 2018, August 2018 and September 2018. The list of parameters for sediment sampling includes Arsenic (As), Cadmium (Cd), Chromium Hexavalent ( $\text{Cr}^{6+}$ ), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni) and Zinc (Zn). Results obtained were compared with the National Water Quality Standards for Malaysia, Class IIB (Recreational use with body contact).
