

# HOSPITAL INFORMATION SYSTEM MODELING

HAMID REZA KAGHAZCHI

UNIVERSITI TEKNOLOGI MALAYSIA

## ABSTRACT

A hospital consists of different organizational units with specified activities. Conduction of an effective communication throughout this heterogeneous organization is very intensive. Developing a comprehensive model is essential for information managers to ensure about the quality of information systems and understanding the communication within the hospital. So far, many various models have been developed to support the information managers but each one of them present only one aspect of hospital information system. This study is set out to consider the different suggested models for hospital information system and then to look at their advantages and disadvantages in comparison with other models. Pusat Kesihatan UTM has been chosen as a particular small-medium hospital to explore the problems in the heterogeneity of hospital information and to experiment the selected hospital information system model. This is where this project comes in; to study the current information system architecture and the quality of information system at UTM Clinic and to propose a comprehensive hospital information system model to support information system managers who are involved within the clinic. Qualitative method is used to get needed information and study the current situation of information system at the clinic. Internal interview was carried out with the director and information manager of Pusat Kesihatan UTM to understand the weaknesses of the current system within the clinic and also to recognize the expectations of top managers of the clinic. Certain common standards such as reference models were used to identify the existing gaps within the current system and suggest an efficient strategy towards implementation. Through the analysis of different models, this study came up with a meta model called 3LGM which present three aspects of hospital information system that include enterprise functions, logical tools, and physical tools and the relation between each layer with other layers. It is hoped that this project can provide benefits to the Pusat Kesihatan UTM.

## ABSTRAK

Sesebuah hospital mempunyai pelbagai unit organisasidengan aktiviti yang tertertu. Kelancaran komunikasi yang efektif menerusi organisasi heterogeneous adalah sangat intensif. Membangunkan model yang lengkap adalah penting kepada pengurusan maklumat untuk memastikan kualiti system maklumat dan pemahaman berkomunikasi antara hospital. Setakat ini, pelbagai model telah dibangunkan untuk membantu menguruskan maklumat namun setiap satu daripadanya hanya membicarakan satu aspek dalam sistem maklumat hospital sahaja. Kajian ini dibuat untuk mempertimbangkan perbezaan model. Model yang disarankan untuk sistem maklumat hospital dan seterusnya memerhatikan kebaikan dan keburukan dalam perbezaan model. Model yang dimaksudkan iaitu Pusat Kesihatan UTM telah dipilih sebagai hospital medium kecil untuk mencari permasalahan *heterogeneity* dalam maklumat hospital dan untuk mengkaji model sistemmaklumat hospital.. Projek ini menengahkan kajian terhadap sistem maklumat arkitek masa kini dan kualiti dalam sistem maklumat di klinik UTM dan untuk menawarkan model sistem maklumat hospital yang lengkap untuk menyokong sesiapa yang menguruskan sistem maklumat antara klinik. Kaedah kualitatif yang digunakan untuk mendapatkan maklumat yang diperlukan dan mengkaji situasi sistem maklumat di klinik pada masa sekarang. Interaksi dalaman telah diadakan bersama pengarah dan pengurus maklumat Pusat Kesihatan UTM untuk memahami kelemahan sistem sekarang antara klinik dan juga mengenalpasti tanggapan dalam pengurusan yang tertinggi di klinik. Seseengah model seperti model rujukan digunakan untuk mengekal pasti jurang yang wujud dalam sistem sekarang dan mencari strategi yang cekap untuk menghasilkan sesuatu yang lengkap. Menerusi kajian dalam perbezaan model meta yang dipanggil 3LGM yang menerangkan 3 aspek sistem maklumat hospital yang mengandungi aktiviti berfungsi, peralatan logik peralatan fizikal dan hubungan antara

satu lapisan dengan satu lapisan yang lain. Ini menjadi harapan bahawa projek ini dapat memberi faedah kepada Pusat Kesihatan UTM.

## **CHAPTER 1**

### **PROJECT OVERVIEW**

#### **1.1 Introduction**

Information handling is extensive and critical in the work of most organizations. Hospitals are also one of these organizations in which information systems have especial importance. It has been estimated that as much as two thirds of the work of health professionals within the hospital involves information handling. Sufficient information is essential to the health care process, to the management of health care organizations, and to the advancement of the field through research and teaching. Almost all healthcare professionals need a large amount of information. It is an essence for the quality of patient care and for the quality of hospital management to fulfill these information needs. Currently healthcare relies heavily on the ability of health information system (HIS) to assist in the diagnosis, management, education, and to health services provider.

Due to the importance of information processing as a quality and cost factor, a hospital has to invest systematically in hospital information system. The amount of clinical data is increasing concerning to the advances in medical information technology. Otherwise hospital information systems are going to shift to distributed

systems in stead of isolated systems. Because of these reasons, hospitals are encouraged to have an adequate system to manage hospital information system.

First of all, this thesis considers various models for hospital information systems and comparing them with 3LGM.

In next step, current information system architecture of UTM Clinic is defined by using Unified Modeling Language (UML).

Going step further, it determines the quality of information system in UTM Clinic by developing 3LGM respective current HIS. At the end, it proposes a new 3LGM for UTM Clinic according to the HIS requirements and information needs. Suggestion about implementing the improved system strategy is the following step in this study.

## **1.2 The Background of the Problem**

Heterogeneity is inherent to hospitals. A hospital consists of various organizational units with differing tasks for various types of healthcare professionals. Since integrated care should be the aim, a high degree of interoperability has to be reached. This requires intensive internal communication among organizational units and healthcare professionals as well as external communication (Winter, Brigl, Wendt, 2003).

The hospital is itself a system, precisely a socio technical system, in which human beings and machines carry out specific actions following established rules. In this context, it is not surprising, that constructing and managing communication and interoperation needs a socio technical approach (A.Winter, and R. Haux, 1995, A. Winter, B. Brigl, and T. Wendt, 2003).

Managing clinical information is a challenge with unique requirements, and so far, no system has been able to address the complexity of the entire hospital

environment. Some medical information systems such as Hospital Information System (HIS), Picture Archiving and Communication System (PACS), Radiology Information System (RIS) and Laboratory Information System (LIS) are used in hospitals now, but they are usually heterogeneous and isolated. Data is incomplete, workflow is discontinuous, and management is not uniform (Xudong Lu et al. 2005).

Hospital involves a multitude of patient-hospital interactions, and these interactions require a complex network of communications and information systems. There is a lack of information to support the primary processes. The respondents suggest data management and files to be patient oriented in stead of specialist or departmental orientation.

As an attempt to explore the problems in the heterogeneity of hospital information, this research shall focus on a particular small-medium hospital i.e. UTM Clinic.

In this thesis, Three-Layer Graph-based Meta-model (3LGM) has been used and developed to support management of information systems at the Health Center in University Technology Malaysia. This model effectively describes and models HIS by hospital functions, application systems and physical data processing components. It serves to uncover weaknesses such as unintended redundancies, bottlenecks and etc.

### **1.3. Problem Statement**

1. How to support strategic information management in hospital informtion system (HIS)?
2. How to understand the hospital's enterprise functions and the way they can be adequately supported by information and communication technology?
3. Which model is able to provide a terminology or ontology for designating HIS and their components which will serve as a blueprint to information system managers?

4. Which model is able to represent different aspects of HIS (functions, logical tools, physical tools) and also the relationship between them?

#### **1.4. Project Objective**

The objectives of this project include:

- i. to study the current UTM clinic information system architecture
- ii. to determine the quality of information system at UTM Clinic by using 3LGM, Heidelberg reference model, and Requirements Index for Information Processing in Hospitals, Version 1.0b.
- iii. to propose a hospital information system (HIS) model for UTM clinic
- iv. to propose an implementation strategy towards implementation

#### **1.5. Scope of the Project**

These are the identified scopes which define the boundary of the project:

1. This research will look at the hospital enterprise functions recognized in UTM Clinic and their existing path with application components and physical data processing components.
2. This research will focus on analyzing current status of information system architecture UTM Clinic.

#### **1.6. Importance of Project**

The heterogeneity of a hospital is reflected by its HIS. Like an architect the information manager needs a blueprint or model not only for planning the
