ROAD MAINTENANCE MANAGEMENT SYSTEM : A CASE STUDY AT
PUBLIC WORK DEPARTMENT

NURUL WAHIDA BINTI MOHAMED

A project report submitted in fulfilment of the
requirement for the award of the degree of
Master of Science (Construction Management)

Faculty of Civil Engineering
University of Technology Malaysia

APRIL 2010
ABSTRACT

Road should be viewed as an important national assets. Like any other assets, road must be regularly maintained to keep them serviceable. The study conducted on the Road Maintenance Branch, whereby this branch was established specifically to manage the assets of the Federal Road to the Public Work Department of Malaysia. The aim of this study is to investigate on how to improve road maintenance management system in order to reduce time and cost. The study is carried out through interviews, questionnaires and archives from the Public Work Department. Interviews were conducted with the personnel involving in road maintenance management. The questionnaires were distributed to those who are involved in maintenance activities at the Public Work Department. The type of road involved in this study was a Federal Road, P27 under Public Work Department supervision. The data collected were analyzed using an average index method to obtain the result. From the result, the most common problem occur during the implementation of Road Maintenance Management System is to get the funds for the road maintenance. Public Work Department should consider to monitor the work carried out by the concessioners in order to improve the Road Maintenance Management System.

CHAPTER 1

INTRODUCTION

1.0 INTRODUCTION

According to Ahmad (2002) maintenance is always a must for any structure in order to maintain its serviceability and to prevent deterioration that may shorten the service life. In reality, maintenance works are not given the attention it should have a budget allocated for maintenance work in which seldom become a prior consideration. However, it is a fact that maintenance is the most important and the activity to be carried out to prolong or at least maintain serviceability of structure until the end of its service life.

Structures as stated do not solely refer to buildings. Other structures such as bridges, roads, harbours, drainages and any kind of engineering structures are also included. Maintenance on these structures may differ in various ways, but all of it must be carried out in a strategic and systematic way. This study is conducted to investigate on how to improve Road Maintenance Management System.
1.1 BACKGROUND OF STUDY

In this new era, the product we design not only for use and demolish but we start to find or consider new strategies to effectively protect, manage and sustain our pavement so that not only they are safe to use, but can also be maintained effectively and last longer.

In Malaysia, especially in government sector many new pavement and surfacing types have been considered by both the engineers in the Public Works Department (PWD) and the consultant engineers. Once the concepts are decided the designers either from the consultants or the PWD are allowed to proceed with the detail design.

With respect to the pavement and surfacing types encountered, a majority of the proposals are of the conventional types. However there are proposals that may be classified as non traditional.

Besides the new design of pavement surfacing types, the major problem still appear. From News Straits Time, 18 August 2003 the Chief Director of Work Public says that, “Local authority got more complaint from the road user everyday because of unsatisfied work done”.

Therefore, maintenance the road is important to make sure the traffic flow smoothly. But most of the developed countries are faced with high maintenance cost on the aging transportation highway. Fwa (2006) highlighted that highway maintenance can broadly define as an action taken to retain the road pavement in a safe and useable condition. Road maintenance normally excludes upgrading and strengthening of the road elements, but maybe done if these appear to be the most cost – effective actions in the long terms. Maintenance could be emergency, remedial (routine or recurrent) and preventive (periodic) type.
Road maintenance must be planned, managed, design and executed. Planning and management are done by means of maintenance management systems and procedures. These system and procedures are normally different from a pavement and bridge management systems since it do not focus on long term and strategic repair and upgrading issues. Relevant pavement and bridge can be identified for protective and preventive actions as part of a road maintenance program. On time maintenance is extremely important.

Dipak (2005) conduct a study for roads maintenance at Nepal found that the main objectives of road maintenance is to ensure the serviceability of the road network and minimize the cost of road transportation, which is comprised of

i. Agency cost: Capital cost of construction and maintenance of the facilities over their design life; and

ii. Road User Cost.

Regarding to Reginald (1986), it is important to view maintenance in the context of the overall construction process. The role played by maintenance in the construction process can start from design stage. The involvement of maintenance department in this stage is as an advisor to the designer to figure out the maintenance problem in the future.

Regarding to the Armstrong (1984), some of the advantages of the involvement of maintenance department in early stage are it would able to check the practicability of the design details, the suitability of patent joint, anticipate leaks, staining, expansion joints, and many other things that can prevent further defects in the future caused by miss-design.
1.2 PROBLEM STATEMENT

Most of the road in Malaysia was under responsibility of Department of Public Work (PWD). Maintenance of road was directly under Branch of Road Maintenance. From the statistic of complaint from the road user is 31% on road defect or failure of the road.

Dipak (2005) addressed from his study a number of challenges to achieve sustainable management of Nepal’s road network like institutional problems concerning management and utilization of the fund and capacity constraints in road agencies.

Derek et al (1986) described three main problems in maintenance which are inadequate financial, bad management, and poor design.

Financial is the main measurement for the action will take for maintenance activities and for some households’ maintenance budget is the easiest part to cut if they faced financial problem.

The second problem is bad management, which could be interpreted as idleness and waste among the maintenance personnel. The maintenance manager and the staff’s ability and responsive to the maintenance problem is one of the tool of effective maintenance management.

The design also part of the problem in maintenance. It is important to give more attention to decide which materials and elements will be use, and unfortunately it is uncommon at the design stage both designer and owner take maintenance as one of the design consideration. Poor design also includes the poor quality materials used.
From the above problem, the government spend more money to maintain and repair the road. So, from the study about road maintenance management system, it will help the government how to reduce the cost for maintenance and also to make sure the road in good condition with minimum maintenance.

1.3  AIM AND OBJECTIVES

The aim of this study is investigation on how to improve road maintenance management system. To achieve the aim of this study, the following objectives have been set:

i. To study the road maintenance management system in the Malaysia construction industry;

ii. To identify the common problem in road maintenance management system; and

iii. To identify the basic approach for improving road maintenance management system.
1.4 SCOPE OF STUDY

The scope of research for achieving the goals is focus on maintenance work done for all Federal Road under PWD Supervision and also related to the management system on maintenance at PWD. Road Maintenance Branch is the main target for this study because this branch was implementer for the Road Maintenance Management System. In Road Maintenance Branch, it has a few units that was involved in this study which is “Unit Kejuruteraan Pemulihan Jalan”, “Unit Pengurusan dan Penyelengaraan Jalan Zon Tengah/Timur”, “Unit Pengurusan dan Pemyelengaraan Jalan Zon Selatan”, “Unit Pengurusan dan Penyelengaraan Jalan Zon Utara” and “Unit Kejuruteraan Senggara”.

1.5 RESEARCH METHODOLOGY

To carry out the study, several research methodologies were used, which includes initial discussion, literature review, data collection, data analysis and conclusion. Figure 1.1 showed the flow chart of Research Methodology used to achieve the objectives that have been set.
